Patty Passport — Full Design & Structure Report

Oct 3, 2026

This is a full design and structure report of the Patty Passport website — a Mediterranean burger restaurant site themed as an airport terminal — covering every page, every color and motion decision, and the interaction mechanics behind each one, written to serve as a reference for explaining how the site was designed and built.

1. Brand Concept & Core Idea

Patty Passport is a Mediterranean burger restaurant reframed entirely as an airport terminal: guests don't order food, they "depart" to one of 21 countries, each with its own gate, boarding ticket, stamp and signature plate. This single metaphor governs every design decision on the site — nothing is decorative for its own sake; everything ties back to "this is a journey, not just dinner."

- **21 destinations, 5 routes.** Levant (Lebanon, Syria, Palestine), Aegean (Türkiye, Cyprus, Greece), Iberia & Latin (Italy, Spain, France, Monaco, Malta), Adriatic (Slovenia, Croatia, Bosnia & Herzegovina, Montenegro, Albania), and North Africa (Egypt, Libya, Tunisia, Algeria, Morocco).
- **The passport is the loyalty mechanic.** A real 21-stamp book, not a points app — nothing expires, nothing resets.
- **Every page ends the same way** regardless of what it's about: a boarding-pass-style CTA, reinforcing the terminal metaphor even on data-heavy pages like Investors.
- **One template, 21 countries.** The destination profile is a single page template driven entirely by a shared data file and the URL hash (`destination.html#lbn`), not 21 hand-built pages — this is also what keeps every country visually and structurally consistent.

2. Color System

Exactly 5 core colors run across all 16 pages, with zero exceptions invented along the way. The same 5 are used everywhere — what keeps the site from feeling flat is that the *ratio and role* each color plays (background vs. accent vs. border) changes constantly from section to section, never the palette itself.

Color	Hex	Role
Red	`#ec3013`	Energy, CTAs, "urgent/departed" states
Yellow	`#f2b30c`	Warmth, highlights, the sunny Mediterranean accent
Blue	`#2b76c9`	Water/coast, calmer sections
Ink	`#1b1a19`	Near-black — borders, headers, the structural color
Cream	`#f7f3ec`	The paper/passport-page background

The remix technique: rather than one color per section, grids of cards cycle through the 5-color array **by index** (e.g. `[YEL, RED, BLU][k % 3]`) rather than being hand-assigned, so adjacent cards are guaranteed to differ and a new card added later just keeps cycling correctly. This is what produces the "confetti of boarding passes, no two the same" look across the site almost for free.

Governance: every color used anywhere must trace back to this set of 5. When an earlier pass of the crew section introduced an off-palette green and purple for two role-tag colors, that was treated as a real defect and corrected specifically because it broke this rule — the discipline is what keeps 16 very different-feeling pages reading as one brand.

3. Visual Language

Typography: a single font family, Archivo, used at three weights (400/600/800) for everything on the site — headlines lean on the 800 weight at tight negative letter-spacing (`-.03em` to `-.045em`) for a dense, confident, boarding-board feel.

The hard-shadow "sticker" technique. Nearly every floating prop or card uses an offset box-shadow with **zero blur radius** — e.g. `box-shadow: 14px 14px 0 rgba(27,26,25,.3)` — instead of a normal soft drop-shadow. Combined with a small non-zero rotation (−7deg to 7deg, never perfectly straight), this makes every card read as a physical cut-out sticker sitting on the page rather than a flat rectangle. It's reused on luggage tags, invitation passes, stamp sheets, destination booklets — dozens of unrelated content types, all via the same two-line CSS trick.

Recurring motifs, each used consistently everywhere it appears, never redrawn differently:

- **Boarding tickets / passes** — a cream or colored card, hard shadow, slight tilt, a dashed perforated edge like a tear-off stub.
- **Passport stamps** — a rotated circular badge (`-9deg` to `-10deg`) with a 2–3 letter country/stamp code, used identically on destination cards, My Passport's stamp grid, and the departures-board visuals.
- **Custom hand-drawn icons**, never emoji or a generic icon font — a star/compass/three-circle-cluster set for the three passport types (Junior/Explorer/Family), a leaf/chicken/beef/kids set for dietary tags, a flag-pin for map markers, a 2-letter code badge (RH/PD/DG/KC/TC) for the five crew roles. Every recurring concept gets exactly one real glyph, used everywhere that concept shows up.

Borders over shadows for structure: 2px solid Ink borders define every card, button and section edge across the site — the hard-shadow technique is reserved for floating/draggable-feeling props, while grid layouts (menu cards, crew cards, country cards) use a shared-border grid technique (`border-right` + `border-bottom` on every cell against a bordered container) so the whole grid reads as one cut sheet, not individually-boxed tiles.

4. Motion & Animation Primitives

Everything animated on the site reduces to a small, named alphabet of about six reusable primitives — each one named for *what it does*, never *where it's used*, which is exactly what lets the same primitive show up anywhere.

Primitive	Mechanic	Used for
`ppDrift`	Float + micro-rotate loop (`translateY(-14px)` + a tiny extra rotation on top of the card's own static tilt), 9–13s, staggered per element	Home hero ticket props, Events party props, Junior Explorers kit props, destination kit photos
`ppEq`	Equalizer-bar pulse, each bar its own duration/delay so a row never looks synced	Destination profile culture section (14 bars), nav's small 3-bar "now playing" indicator
`ppPulse`	Expanding ring, `scale(1)→scale(2.6)` fading out — a "ping"	Live/active badges, blinking status dots

Primitive	Mechanic	Used for
`ppTick`	Continuous horizontal marquee; the content array is concatenated with itself (`rows.concat(rows)`) so the loop point at 50% scroll is invisible	Our Story's language ticker, Destinations' country ticker, Rewards' departures board
`ppDash`	A repeating dashed line whose `background-position` animates continuously	The perforated edge under boarding-ticket CTAs
Scroll-reveal (`data-rv`)	Elements start invisible/offset, fade + slide into place on entering the viewport, staggered via `data-rv-d` delay attributes, **re-triggering** (not once-only) so scrolling back up and down still replays it	Every section heading and card grid, sitewide
Parallax (`data-par`)	Vertical offset computed from distance between the element's parent and screen-center, times the element's own factor (`center × -factor × 0.15`)	Home's background decorative elements
Word-stagger headlines	Plain text split into word-level spans, each revealed slightly after the last	Every major section heading on Home

All of these respect `prefers-reduced-motion` : a single global CSS switch collapses every keyframe's duration to effectively instant for anyone who has that OS setting on, rather than needing an override wherever each animation is individually used.

5. Entering the Site — The Navigation Bar

The nav is fixed to the top of the screen on every page, built from four stacked rows, and persists across the entire visit — it is one of a handful of scripts never torn down when you click between pages, so it keeps tracking scroll and state seamlessly through client-side navigation.

Row 1 — logo + account controls. The logo is not an image file: it's a hand-built pixel-art terminal icon assembled from absolutely-positioned divs (a dark square base, an inset cream border, a yellow "departure board" stripe with 3 small windows, more red/yellow stripes, and a circular red-bordered "21" badge overlapping the bottom-right corner — the

destination count baked into the brand mark itself), next to "PATTY PASSPORT" and the tagline "ORDER THE MEDITERRANEAN TO YOUR TABLE." On the right: a **music toggle** (play-triangle + "Play the Mediterranean", swapping to animated equalizer bars + "Playing", pulsing dots + "Loading…", or "Resume the Mediterranean" if you had it on in an earlier visit); the **My Passport button** — a solid black pill reading "My Passport" by default, which automatically swaps to a small yellow dot + your first name + `'s Passport` the moment you're signed in, so the nav itself doubles as a live profile indicator from any page; and the **"All pages"** drawer toggle (3-line icon) opening the full site directory.

Row 2 — Quick Gates. Four gate buttons at a time, from a pool of 10 real pages, each with a small color-coded dot. They **auto-rotate every 4.2 seconds**, fading out and the next group in, and the rotation is smart enough to start on whichever group contains your current page so it's highlighted immediately rather than waiting for the cycle to reach it. A live "Gate X / Y" counter sits on the right like a real departures board.

Row 3 — Now Playing (only visible once music is on): a dark strip, a blinking yellow dot, and the real track + route name pulled from the actual music library data.

Row 4 — the scroll-progress bar. A thin 5px track; a fill bar growing left-to-right with your scroll position, colored with a `linear-gradient(90deg, #ec3013, #f2b30c)` — because the gradient stretches across the fill's own (growing) width, the color visibly warms from red toward yellow the further down the page you go. A small hand-drawn plane icon (26×26px SVG, not an emoji) rides exactly at the fill's leading edge, computed each scroll frame as `scrollY ÷ (document height − viewport height)`, throttled through `requestAnimationFrame` for smoothness.

6. Home Page

Hero: two columns of 12 floating "boarding ticket" props drift past each other — a boarding ticket, a language card, a luggage tag, a gate call, a destination pack, a stamp receipt — each clickable straight into its country's page. Each prop's rotation and drift duration is computed from its own index (`(i % 2 ? 1 : -1) × (1.5 + i % 3)` degrees, `9 + i % 5` seconds) so none float identically.

Headlines: every section heading (15 of them — "PRINTED AT THE DESK. YOURS TO KEEP.", "THE MEDITERRANEAN, ONE TERMINAL.", "FIVE ROUTES. TWENTY-ONE DESTINATIONS.", "MEET THE JOURNEY CREW." and so on) is set as plain text, then split into word-level spans and staggered in on scroll, so headings arrive word by word rather than as one block.

Section-by-section tour, in order:

1. Mediterranean map with clickable country nodes
2. Five-route breakdown
3. Soundtrack teaser
4. "The land behind every plate" — nature/landscape facts
5. The living garden — real native-tree photography per country
6. Passport preview
7. Kids kit props (floating, drift animation)
8. Adult travel kit props
9. "EVERYONE GETS A PASSPORT" — the 3 passport-type cards (Junior/Explorer/Family), each with its own custom icon (star, compass, three-circle cluster)
10. "MEET THE JOURNEY CREW" teaser, linking to Our Story's full crew section
11. Investor teaser
12. Patty Tooty teaser
13. The check-in console (route filter chips)

Every CTA button on the page follows one pattern: solid fill, bold uppercase label, an arrow pushed to the far right via `margin-left:auto`, and a hover-state color swap (usually to red or yellow).

7. Destinations Overview

Top: a continuously-scrolling marquee ticker listing all 21 countries (name + MED-code), built via the same "concatenate the list with itself" trick as every other ticker on the site, so the loop point is invisible.

Filter row: "All routes" plus one button per route, each showing a live count badge (e.g. "Levant 3") computed from the real dataset, never hardcoded.

The grid: each country card shows a photo with the route's own color as a corner label, a rotated stamp-code badge bottom-right (tilted −9deg, like an ink stamp), the country name, a short identity line in dark red, intro copy, and the signature dish + price in a footer row with an arrow.

The hover-reveal layer is the clever part: a second, normally-hidden layer sits under each card — the country's flag plus its native greeting and romanized version — only revealed on hover (`.pp-dst-greet`). Hovering a card feels like it "speaks" to you for a second before you click through, without permanently cluttering the grid view with 21 blocks of foreign-script text at once.

8. Destination Profile

One single template (`destination.html#code`) drives every one of the 21 countries by reading the URL hash and pulling everything else from the shared data file.

Hero: colored in that route's own accent, a greeting bar with proper `dir="auto"` RTL handling for Arabic-script greetings (text-align deliberately pinned left so an RTL block doesn't yank itself away from its LTR siblings), and a quickfacts strip of four colored boxes (capital, population, water, stamp code).

Destination Dossier: a data grid — area, land borders, official language, currency, route + gate code, dietary notes, signature dish, landscape.

Culture section: a 14-bar animated equalizer, each bar its own randomized-feeling height/duration/delay combo — purely decorative energy, not tied to actual audio.

"Say it at the table": the country's own unique welcome phrase (native script, romanized, English meaning) — kept deliberately separate from the hero's universal greeting so the two never repeat each other.

Signature Plate photo: these are tall portrait photographs (food on a board, low in frame, restaurant ambiance above) going into a landscape-shaped card. `object-position` is deliberately biased toward the bottom of the source image so the board, the name card and the full plate stay in frame, with the ambiance cropped from the top instead — the default centered crop was cutting the food off.

Full menu card grid for that country, **4 related-country cards** on the same route, and the page always ends on the same real printed-boarding-pass-style CTA — flag, gate code, dashed perforated edge — tying the very last thing seen on a country page back to the Home hero's own ticket motif.

9. Menu

Three independent filter groups, each its own labeled block with a vertical divider between them so they never visually merge into one jumbled row:

- **Route** — All / Levant / Aegean / Iberia & Latin / Adriatic / N. Africa
- **Course** — All / Burgers / Loaded fries / Salads / Desserts / Drinks
- **Diet** — All / Halal-friendly / Vegetarian / No pork / Alcohol-free / Nut-free

All three combine with AND logic against the full live dataset — nothing sampled, every one of the 21 countries' full menus is searchable.

Each dish card: a small kind-label in its own fixed color (veg/salad = green, beef/chicken = dark red, fries = amber, cold drink = blue, alcoholic drink = purple, dessert = red), dish name, price, description, a row of dietary tag chips each color-coded from a fixed tag palette, then **"+ Add to bag"** (solid black, swaps to red on hover) and — for burgers, fries and salads specifically — a second outlined **"Make it a combo"** button opening a modal to bundle a real combo at a computed combo price.

10. Route Map

Five "chapters," each with real historical/geographic framing copy — Levant: *"Cedar mountains, ancient ports, caravan kitchens and the table traditions of the eastern Mediterranean."*; Adriatic: *"Venetian harbours, mountain interiors, Slavic traditions and a coast where stone, salt and smoke meet."* — each numbered, each listing its actual countries in prose. A legend lets you isolate one route at a time on the map.

The deep-link highlight: arriving via `route-map.html#lbn` (clicked from a country's own "See the route map" button) finds Lebanon, auto-isolates the Levant route, glow-highlights both its map node and its stop card, and scrolls it into view — so "see this on the map" from a destination page lands somewhere meaningful rather than just the generic all-routes view.

11. Events

Yellow-and-black "evening timeline," floating event-prop photos using the same drift animation as Home's hero props, and **4 real upcoming event cards with live per-second countdowns**. Each countdown moves through genuine states — upcoming → "Happening now" during a 3-hour assumed service window → "Departed" after — and the Reserve button is gated by a real 2-hour booking cutoff computed against the actual event date, not a static mockup.

Package cards (Little Explorer Birthday, World Explorer Birthday, Family Reunion, School Journey, Team Departure) each carry real pricing and minimum-guest numbers, reused identically on the Booking page's group-booking types so the two pages never quote different numbers for the same package.

12. Rewards

A **5-step how-it-works strip** (Ask at the desk → Pick tonight's country → Eat the destination → Get stamped → Climb the ladder), each step a different one of the 5 core colors. **Three passport-type tiers** (Junior/Explorer/Family), each with its own reward ladder of unlock thresholds.

The departures board: a looping marquee of all five routes as solid color-blocked rows (full rows, not small dots, so it reads clearly against the red backdrop), the row list rendered twice back-to-back and CSS-animated upward by exactly one copy's height so the loop point is seamless — and it **pauses on hover/focus** so a visitor can actually stop and read a row.

The honest stamp grid: the real 21-cell "Your spread" grid only shows real data when signed in. Signed out, it shows a locked state with a sign-in prompt instead of a public +/− stepper a visitor could use to fake a stamp count — stamps are only ever added or removed from the My Passport page itself, never from here, by design.

13. Junior Explorers

A static (no interactive state) kids-focused page. **5 floating kit-prop photos** — junior passport, route booklet, flag stickers, explorer tote, destination postcard — using the same drift-prop pattern as Home and Events, with the same per-item rotation/duration variety. A **6-item kit breakdown**, each with its own custom icon. A **5-item "what they actually learn" strip** (where countries are / words in other languages / flags and what they mean / that food comes from somewhere / how to try something new), each with a 2-letter mark badge (21/AB/FL/FD/TR) — the same visual language as the crew role codes (RH/PD/DG/KC/TC), reused for a completely different concept.

14. Booking

A real date/time-aware console using **native `<select>` / `<input>` controls**, not custom chip buttons — deliberately, so the form works properly with a keyboard or screen reader like any ordinary web form. Real business-hours logic: weekday hours (10:00–22:00) vs. weekend/holiday hours (10:00–00:00), computed from whichever date is actually picked. Booking type drives everything below it — which fields show, which days/times are offered, what the ticket preview says — and the six group-booking types reuse the exact prices and minimums already published on the Events page, nothing invented twice.

The confirmation renders as a real **printed-boarding-pass-style ticket**, explicitly labeled front-end-only: nothing is actually charged or sent.

15. Our Story

A scrolling **language ticker** (every country's "welcome" word, the same double-concatenated marquee trick). A **5-card "What We Believe" values grid**, each card a different core color: No house style / Identity over trivia / Everyone travels / Paper over apps / The room is the story.

A **"How We Got Here" timeline, 2022→2028**, deliberately honest about what's actually complete versus still planned — nothing is marked done that isn't, and 2026 stays present-tense since it's the year genuinely in progress. A **4-item mood board** (Terminal, not theme park / Loud where it matters / Print you keep / Warm, not precious).

Then: **Founders** (Mazen and Ahmed, their real-world backgrounds in trade/logistics and retail, an honest grey "to be supplied" placeholder where a real photo isn't available yet — never a stock photo standing in for a real person), the **5 unnamed crew-archetype cards** (Route Host, Passport Desk, Destination Guide, Kitchen Crew, Table Captain, each with a real photo), and the **8 named Featured Crew** with reviews (covered in full in the Crew section below).

It closes on an **"Every table is someone's first trip"** module: two small illustrative 21-cell stamp rows sitting beside the copy — one nearly full, one empty — visualizing "some guests have been to nineteen, some have been to none" instead of leaving that side of the layout empty.

16. Crew — Featured & Full Roster

Featured Crew (Our Story, 8 named people): each card shows a name, a role badge formatted consistently as code + full title (e.g. "RH — Route Host"), a nationality/origin tag, a short bio tied to what they actually do, a live star-rating summary if reviews exist, and a **"Leave a review"** button that scrolls to a review form, pre-selects that person, and focuses the text field. The 5-star widget lights up yellow on hover/select and submitting adds the review live — no reviews are pre-seeded, so an unreviewed profile honestly says "No reviews yet — be the first to leave one" rather than faking social proof. Photo slots use the same honest grey "to be supplied" placeholder as the founders, not a colored initials panel — kept visually consistent with how missing photos are handled everywhere else on the site.

Full Roster (crew.html, 35 people): every person is locked to exactly one of **5 fixed roles**, each with a 2-letter code and a fixed description:

Code	Role	Description
RH	Route Host	Greets the table, reads the route, and decides where you're flying tonight.
PD	Passport Desk	Prints the boarding ticket, stamps the book, tracks the ladder.
DG	Destination Guide	Knows the country — the dish, the phrase, the story behind the plate.
KC	Kitchen Crew	Cooks twenty-one countries without flattening any of them.
TC	Table Captain	Runs the service, the birthday games and the final stamp.

A filter bar uses exactly these five codes plus "All roles" — no invented categories. Each card shows a person-initials monogram badge, the role badge in the same code+title format, nationality/route, bio, and a "Featured" tag on the 8 who also appear on Our Story, so the two pages read as one consistent team rather than two different casts. Role-tag colors are drawn only from the site's 5-color palette (an earlier pass had accidentally introduced an off-palette green and purple, corrected specifically to preserve the palette discipline).

17. Investors

The most data-dense page on the site, built to read as genuine investor-grade information design rather than decorative charts:

- A **break-even chart** with real axes and gridlines, dual-axis guides, and a margin-of-safety indicator — not a stylized shape standing in for data.
- A **2×2 positioning map** with named competitors plotted on it and the real Patty Passport logo as its own marker (not a generic mascot icon).
- An **Ansoff Matrix** and a **market segmentation** breakdown, both interactive.
- **ROI figures kept in a visually separate row** from payback-period figures specifically so the two are never confused at a glance — an earlier version had them blended together, which read ambiguously.
- A phased **rollout plan** (2026–2035) and a full cost/assumptions audit with exact documented figures rather than rounded placeholder numbers.

18. My Passport

Signed out: a split hero. Left: a blinking red "My passport · sign in" tag, the headline "YOUR BOOK IS WAITING AT THE DESK.", and two buttons — "Create my Patty Passport" / "Log in." Right: a real photo of an open, stamped passport booklet with a dark strip reading "21 countries · 4 reward gates · nothing expires."

The sign-up/login modal: a dark "Passport desk" header styled like an airport desk window. For Create, a **passport-type picker** (Junior/Explorer/Family, each with its own real icon) whose tagline updates the moment you pick one, then Name + Email and a submit button. Deliberately placed in the modal itself, not buried in fine print: *"Demo account — stored only as plain data in this browser's local storage, not on a server, with no password check. Not a real, secure account: don't use a real password here."*

Signed in — the profile:

- An 86×86px avatar slot with a small "+" upload button; picking a photo previews it instantly (nothing is actually uploaded anywhere — a local object URL only). No photo yet shows the same honest grey placeholder pattern used sitewide.
- Passport type + icon, a generated membership number (`PP-2026-0XXX`, computed from stamp count), name in large bold type, and "Book the next route" / "Log out" buttons.

- A **4-box live stat strip**, each box a different core color: stamps collected, countries to go, stamps to the next reward, rewards unlocked — all computed from the real stamp array.
- **Left column — "Your Stamp Spread":** a route filter, a search box, "Select all 21," and a dynamic "Clear [route] stamps" button, over a grid of all 21 countries. Tapping an unstamped cell stamps it instantly; tapping an already-stamped cell **arms a two-step confirm** ("Remove Lebanon stamp? [Remove] [Cancel]") rather than removing immediately, so a stray tap can never erase a real stamp. A stamped cell shows a rotated red circular stamp badge with that country's real stamp code.
- **Right column — "Rewards":** the 4-tier reward ladder, each tier showing "Unlocked" or "X to go," color-cycled through the core palette; below it, **"Upcoming"** — a dark panel of mock bookings (date, destination + gate code, party details) and an "Add a departure" button into Booking.

19. Patty Tooty — AI Concierge

Location: a small fixed bubble, bottom-right corner (`right:18px; bottom:18px`), present on **every page simultaneously** — it self-mounts with no placeholder needed and, because it's in the router's permanent shared-script list, is never destroyed or rebuilt as you click between pages.

Closed state: a black pill button reading "Ask Patty Tooty," with a round yellow badge on the left holding Patty Tooty's own custom hand-drawn mascot icon (a burger-bun face, not a generic chat icon) and a small red notification dot in the corner that blinks on a steady loop.

Opened state: a 320px chat panel — a dark header bar with the mascot icon, "PATTY TOOTY," and a pulsing yellow dot + "Online" label; a scrollable message log over a faint ruled-paper background, Patty Tooty's replies in white bubbles beside the mascot icon, the user's messages in blue bubbles aligned right; **4 quick-question chips** ("Pick a destination," "Vegetarian?," "Halal?," "How do stamps work?") that **disappear permanently the moment a real message is sent**, so the UI visibly shifts from "FAQ list" to "real conversation"; a **typing indicator** (three pulsing dots) for roughly half a second to a second before each reply, randomized slightly so it doesn't feel mechanical; a text input + Send button; and a quiet "Open full concierge →" link to the dedicated full-page version.

What it actually knows: a real keyword-matching engine reading the site's live data — ask about a specific country by name and it returns that country's actual identity line and headline dish; ask "vegetarian" and it randomly surfaces one of the 21 countries' real

vegetarian dish; ask about investing, hours, halal, spicy food, kids, events, booking or stamps and it answers on-brand with a clickable link straight to the relevant page; ask who founded it and it names Mazen and Ahmed specifically. A specifically-worded fallback handles flirty messages by staying in-character and redirecting warmly to the crew/story pages rather than either playing along or refusing awkwardly.

On the dedicated full-concierge page itself, this floating bubble automatically hides (the router checks for that page's own chat thread and tells the widget to disappear), so two overlapping chat windows never show at once.

20. Soundtracks

A dedicated music page: pick a route, then open any of its countries for that country's own soundtrack card. Tracks **interleave round-robin across all five routes** (one Levant, one Aegean, one Iberia & Latin, one Adriatic, one North African, then repeat) rather than playing one route front-to-back before moving to the next — so an early "play the Mediterranean" queue samples the whole map quickly instead of parking in one region. Only tracks with a real source file are ever queued; the system activates further tracks automatically as more go live, nothing invented ahead of time.

21. Legal & Footer

Legal is a straightforward, anchor-linked FAQ / allergens / privacy / terms hub.

The footer is the one structural element that never varies: every single page on the site, no matter how differently it's remixing the palette and motion described above, ends on the exact same full-width, Ink-background dark block — a sitemap-style link cluster, social links, a copyright/legal line, and location/contact info. However much the 16 pages differ from each other above it, they all close on the same quiet, information-dense note. That unchanging ending is what makes all the page-to-page variation read as one coherent brand instead of a set of disconnected experiments.

22. Technical Architecture

The site is a set of plain static HTML pages given SPA-like behavior by a lightweight client-side router: clicking an internal link intercepts the real navigation, fetches the target page, and swaps only its unique content region into the current document — so the nav, footer,

music player and Patty Tooty widget are never torn down and rebuilt, which is what lets background music keep playing uninterrupted as you browse.

Shared vs. page-specific scripts. A fixed list of scripts (nav, data, flags, icons, hover/reveal engines, music, auth, footer, the bag, the Patty Tooty widget, the router itself) are loaded once and never re-run on navigation — they hold state that must survive page changes. Every other script is page-specific and gets re-injected and re-executed after each swap so its render logic runs again against the freshly-swapped markup; dynamically re-injected scripts are explicitly set to execute in document order (not racing on whichever finishes downloading first), since some pages ship a shared data file before their own render script specifically so the render script can read that data immediately.

One shared data file, 21 countries. All destination content — names, routes, menu items, prices, cultural facts, phrases — lives in a single data file, with the destination-page template, the menu, the destinations grid, the route map and the Patty Tooty concierge all reading from that one source. This is what guarantees the 21 country pages, the menu, and the AI concierge's answers can never drift out of sync with each other.

Cache-busting. Every script and stylesheet reference carries a version query string, bumped on each deploy so a returning browser can't keep serving a stale cached copy of a file that actually changed.

Demo-only state, clearly labeled. The "My Passport" account, its stamps, and session-only features like the shopping bag and crew reviews are all explicitly front-end-only — no server, no real backend — and every one of them says so plainly in its own UI rather than letting a visitor assume more permanence than actually exists.

23. Why It Feels Interactive & Alive

What makes customers find the site interactive rather than just decorated is a small set of disciplines, applied consistently rather than a long list of individually clever tricks:

1. **A closed palette, deliberately remixed per section** — the same 5 colors everywhere, cycling by index rather than fixed per section, so no two adjacent elements repeat and the whole site stays visually unified without ever feeling flat.
2. **A small reusable motion alphabet, not one bespoke animation per page** — six primitives (drift, equalizer pulse, ping pulse, ticker marquee, dashed-line motion, scroll-reveal/parallax) recombined across completely unrelated content, which is what makes a returning visitor keep noticing new combinations rather than "the same animation again."

3. **The homepage as a remix trailer** — Home pulls a genuine fragment of nearly every other section, recomposed in its own layout, never the full version — so exploring further always feels like discovering more of something already glimpsed, not starting cold.
4. **Closed vocabularies for anything repeatable** — exactly 5 crew roles, exactly 3 passport types, exactly 5 routes, never an ad hoc addition — which is what lets filters, badges and search all stay trustworthy and consistent everywhere at once.
5. **Honest placeholder design** — a missing photo or an unfilled review is designed to look deliberately "not yet filled," using the same consistent grey pattern sitewide, rather than faked with a stock photo or hidden with a blank box that would read as broken.
6. **Real logic behind the "cool stuff," not just decoration** — the event countdowns, the stamp tracker, the combo pricing, the booking console's date rules all compute something genuine; motion and polish land far better when attached to real state than when animating for its own sake.
7. **One unchanging closing structure** — the dark footer every single page ends on, regardless of how differently that page used the palette and motion above it — which is what lets 16 visually varied pages still read as one coherent, trustworthy brand rather than a set of disconnected experiments.
