SAM ELECTRONICS L.L.C · DEIRA · DUBAI · SINCE 2003

HOME PAGE

Round 6 · Finish it

Every owner point · 45 screenshots
new product system · real boxes · real logos

The last update got slightly worse.
Fix it properly: smooth, realistic, alive.

To: Claude Code
From: the owner, Sam Electronics
Date: 19 October 2026 · builds on the 13 Oct and 14 Oct documents
Where this document disagrees with any earlier one, THIS document wins.
Read all of it before changing a single line of code.

READ FIRST

How to use this document

The owner tested the live site on 18–19 October and sent 45 screenshots. His verdict: **the last update became slightly worse**. Some things improved (the hero text/button separation, the wholesale tape, the pallet idea, Our story, the bench test), but the site is **slow and glitchy**, the teardown **traps the visitor**, several things were **redesigned without being asked** (the favicon, Samsoom), the Arabic layout is **awkward**, and many props still look **cartoonish**.

This round finishes the home page so customers can use the site. After it: the detailed pages for each section, then the Control Room (admin) and real buying.

THE SEVEN GOLDEN RULES

1. **Improve, never rebuild what works.** Delete nothing and redesign nothing that is not named here. If the owner didn't mention it, keep it.
2. **Never redesign a brand asset on your own.** The favicon and Samsoom were changed without being asked: both go back to the originals (§01, §19).
3. **No highlighted titles, anywhere, ever.** The yellow marker band behind/under words ('One shop in Deira', 'guaranteed', 'We serve everyone like family', 'Same management since day one', the Arabic reviews title) was dropped long ago. Remove every one. The second line of a title may be yellow TEXT, never a highlighter.
4. **Performance comes first.** Part A must be done and measured before any visual work.
5. **Never trap the visitor.** No section may stop the page or force extra scrolling (Part B).
6. **Realism standard:** every device, part, box, pallet, globe and prop must look like a studio 3D render, like the teardown parts. Nothing flat, 2D or cartoonish.
7. **One section = one commit.** Build, Playwright screenshots (1440×900, EN and AR), check the DONE WHEN list, merge to main.

Order of work

Step	What	Why first
1	Part A · Performance	Everything else feels broken while the site lags.
2	Part B · Scroll engine (teardown, showcase, story, logo-to-top, progress bar)	The visitor gets trapped.
3	Part C · Global rules (titles, circuits, motion, buttons, Samsoom bubble)	They apply to every section.
4	Part D · Arabic rules	Every section must follow them.
5	Part E · Product system: the Excel catalogue, brands, qualities, boxes + LCD 3D style	Changes the parts shown in almost every section.
6	§01 → §24 in page order	Section by section.
7	Final check + PROGRESS.md	PASS / NOT DONE for every item.

Where this document overrides earlier ones

Topic	Before	Now
Favicon	New yellow/graphite icon	**The original logo** (white circle, iPad + phone + text) with a clear yellow ring. §01

Topic	Before	Now
Arabic layout	Full mirror of everything	**Mirror the layout, keep the look:** blocks swap sides with identical spacing; device groups and objects are not flipped. Part D, §03
Teardown → What we offer	Long graphite → light blend	**Cancelled.** What we offer gets its own background. §06
What we offer parts	Spinning, cheap-looking	**Keep the motion, make it premium:** lit turntables turning in perfect sync; stronger cards. §06
Showcase	Pinned while it plays	**Not pinned.** Auto-plays like the ads; free scrolling. §09
Brands	14 brands incl. Sony	**15 brands** in 4 groups; Sony removed; Nokia + OnePlus added. Part E
Grades	Original · Service Pack · OLED · Incell · High Copy	**The Excel's Quality + Manufacturer lists**; High Copy removed. Part E5
Pallet max	500 units	**5,000 units.** §12
Locations map	Coded map	**Real Google Maps embed.** §15

OVERVIEW

Everything in this round

Code	Part / section	Screenshots
A	Performance	all
B	Scroll engine: never trap the visitor	08–18
C	Global rules	many
D	Arabic rules	07, 15, 25, 43–45
E	Product system: the owner's Excel, 15 brands, qualities, 3D box + LCD	boxes + logos pages
§01	Tab title, favicon, loading	01
§02	Header: hours pop-over, progress bar, logo, menu	01, 45
§03	Hero: search, ticks, phone ads, screens, iPad, Arabic	01–07, 10, 11
§04	Brand stock bar	08, 12, 13
§05	Teardown	08–18
§06	What we offer + three boxes	19, 20
§07	Live parts board	21
§08	Bench test	22
§09	Showcase · screens by quality	23
§10	Deals & arrivals	24, 25
§11	Repair Lab	26, 27
§12	Wholesale & trade	28–30
§13	Worldwide network	31, 32
§14	Our story	33
§15	Locations	34
§16	Team + Join the team (below the rail, application drawer)	35
§17	Who are you?	36–39
§18	Sam Circuit membership	40
§19	Meet Samsoom	41
§20	The feed	42
§21	What customers say	43
§22	Closing brand block	44
§23	Footer	45
§24	Final check	

PART A · DO THIS FIRST

Performance: make it fast and smooth

> **THE OWNER SAID:** I told him to optimise the whole website, but it's still the same issue. It's so, so slow sometimes and glitches, literally glitches. It feels heavy to move and scroll, sometimes freezes, and bugs appear showing sections wrongly before correcting themselves. This website must be quick: I should be able to scroll smoothly, with crystal-clear graphics.

Targets (measure before and after, write both in PROGRESS.md)

Metric	Target	How to measure
Scroll frame rate	≥ 55 fps on a normal laptop, every section	Chrome Performance panel, recorded scroll top → bottom
Largest Contentful Paint	< 2.5 s	Lighthouse, desktop + mobile
Interaction to Next Paint	< 200 ms	Lighthouse / Web Vitals
Cumulative Layout Shift	< 0.05 (no section 'jumps' into place)	Lighthouse
Main-thread long tasks while scrolling	none > 50 ms	Performance panel
JS on first load	as small as possible; three.js only loaded when needed	next build output

Likely causes to check (fix the real cause, never remove an effect)

1. **Too many live things at once.** Only sections within ~1 screen of the view may be mounted and animating. Mount a section's heavy parts (WebGL, canvases, video, big SVG animations) when it comes within 1 screen, pause it when it leaves, unmount it when it is 3+ screens away.
2. **WebGL:** one shared renderer, at most 2 live scenes, devicePixelRatio capped at 1.5, no per-frame material/geometry creation, textures compressed. Render only when something changes (on-demand rendering) for still scenes.
3. **Scroll handlers:** no React state updates on every scroll event. Use passive listeners + requestAnimationFrame, and write to CSS variables / refs.
4. **Expensive CSS:** big backdrop-filter blurs, many large box-shadows, filter: blur() on moving elements, animated gradients over full screens. Replace with pre-rendered images or cheaper versions that look the same.
5. **Images:** every image AVIF/WebP, correct size for its slot, lazy-loaded below the fold, with width/height reserved.
6. **'Sections showing wrongly before correcting':** the first server render must already be the section's start state (no flash of the end state, no flash of unstyled content). Reserve every section's height. Fonts preloaded with size-adjusted fallbacks.
7. **Bundle:** split each heavy section into its own dynamic import; load three.js only for the sections that use it.

DONE WHEN (every box must be true, or the section is not done)

[ ] fps, LCP, INP, CLS recorded before and after, all targets met.
[ ] No visible flash or jump when any section enters.
[ ] Scrolling top → bottom → top with the mouse wheel AND by dragging the scrollbar feels smooth.
[ ] No effect was removed to reach the numbers.

PART B

Scroll engine: never trap the visitor

THE OWNER SAID: Big issue: when you scroll quickly from bottom to top or top to bottom, the teardown stops you and you can't bypass it, even if you already played it. It freezes, you get stuck, and it replays the transition wrongly. If a customer is in a hurry, let them pass and let the transitions happen as quickly as they need, especially if they're using the scrollbar on the right. When the logo is pressed it must take you home immediately, vroom, scroll up, not stop at the teardown where you get stuck. The progress bar above should let me scroll or go back freely.

B1 · Two speeds, decided automatically

Visitor behaviour	What the scroll-driven sections do (teardown, our story)
Normal, deliberate scrolling (one gesture at a time)	**Step mode:** one gesture = exactly one step, played in full, never skipping. Extra scrolling during a step is ignored (no double steps from one big flick).
Fast scrolling: several gestures quickly, a long flick, or velocity above a threshold	**Pass-through mode:** the section does not hold. Its steps play fast-forward (or are skipped) to match the scroll, and the visitor leaves the section with no stop.
Dragging the scrollbar, pressing End/Home/PageDown, clicking the logo, a nav link or the progress bar	**Jump:** no hold at all. The section snaps silently to its end state (going down) or start state (going up).
Coming back later	It replays properly from its start when entered again normally (going down) and plays backwards when entered from below.

B2 · Logo = home, instantly

- Clicking the logo (or 'Home') scrolls to the top in ~600 ms with a fast ease (or instantly with prefers-reduced-motion).
- Nothing on the way may stop it. The teardown and story switch to Jump mode during this scroll.

B3 · Progress bar = scrubber

- The thin yellow progress line under the header becomes interactive: click anywhere on it to go to that point of the page; drag its dot to scrub.
- Hover shows a small label with the section name at that point (e.g. 'Teardown', 'Wholesale').
- Uses Jump mode (B1). In Arabic the bar runs right → left.

DONE WHEN (every box must be true, or the section is not done)

[ ] Fast scroll top → bottom and bottom → top: never stuck, never frozen, in EN and AR.
[ ] Dragging the scrollbar through the teardown: no hold.
[ ] Logo click from the footer reaches the top in under 1 s.
[ ] The progress bar can be clicked and dragged.
[ ] Slow scrolling still gives the full one-step-per-gesture experience.

PART C

Global rules for every section

THE OWNER SAID: Never ever use those titles with a yellow line on them, as if highlighted. The website must have constant animations as you scroll, stuff moving in; now it's dry, not all sections have that. So many slides lack circuits or stuff moving: propose circuits in places but without making them messy. I need this website so fun. More moving items like the tape rolling in the wholesale section would be cool. Add buttons where needed. Sometimes text is cut and not clear in Arabic and English.

C0 · The motion language (the whole site)

THE FEEL: Scrolling the home page should feel like watching a product launch film that you are directing with your thumb. Every section is a scene: it arrives, it breathes, and it hands over to the next one. Nothing is ever just sitting there waiting.

Rule	Exact spec
Depth while scrolling	Three layers move at different speeds: background textures and far circuits at 0.85× the scroll, content at 1×, small foreground accents (sparks, dust, tags) at 1.1×. This makes every section feel deep, like a camera dolly.
Entrance vocabulary	Each section uses ONE signature entrance (named in its chapter) so they never feel the same: **Rise** (fade + 32px up + 0.97→1), **Light reveal** (a soft yellow light sweeps across and the content appears behind it), **Power-on** (a circuit pulse travels to the element, which switches on), **Assemble** (pieces glide in from their sides and lock with a tiny glow), **Unbox** (a lid lifts, the item rises).
Hand-over	As a section leaves, its last element fades to 85% and drifts up 20px while the next section's first element arrives. A circuit line can cross the boundary and 'deliver' a pulse into the next section's first element. Colour changes use a soft 120px seam, never a hard line and never a long muddy fade.
Idle life	Every section has one **hero loop** (8–14s, the main motion) and one **micro loop** (2–4s, a small detail: a blinking LED, a ticking counter, a pulse).
Rhythm	Busy scenes alternate with calm ones, so the visitor never gets tired: hero (busy) → brands (calm) → teardown (busy) → What we offer (medium) → board (calm)…
Timing palette	Micro 150–250ms · UI 300–450ms · entrances 600–900ms · hero moves 1.2–2.0s. Entrances ease out (cubic-bezier(0.16,1,0.3,1)); camera moves ease in-out (cubic-bezier(0.65,0,0.35,1)). No bounce, no elastic, ever.
Replay	Leave a section and come back: it replays its entrance. Reduced-motion users get fades only.

C1 · Titles

- Remove **every** highlighter band behind or under title words (seen in §06, §09, §11, §14, §17, §21). Search the code for the highlight style and delete it.
- Allowed: white + yellow second line on dark, graphite + yellow second line on light. Nothing else.

C2 · Alive, every section

- Every section has (a) an entrance as it enters the view and (b) at least one gentle **continuous** motion while visible: a rolling tape, travelling circuit pulses, a slow light sweep, drifting particles, a looping marquee. Subtle, premium, never busy.
- Animations replay every time the section re-enters (scroll down, up, down: same show).

- Sections that currently feel dry and must get this: What we offer, Live board, Showcase, Deals, Repair Lab, Our story, Locations, Team, Who are you, Membership, Samsoom, Feed, Reviews, Closing block.

C3 · Circuits

- Add circuits to sections that have none, matching the hero style (thin yellow lines, round pads, 45° bends).
- **They must work:** light pulses travel along them every few seconds. A circuit that never lights up is not allowed.
- **They never touch text, buttons or cards**: a 24px safe zone around every text block (§06 shows circuits running through 'Broken today. Fixed today.').

C4 · Buttons and alignment

- Where a card or box has a button, buttons in sibling cards sit at the **same height, same size, same padding** (bottom-aligned).
- Add buttons where a section has none and a next step is obvious (e.g. Locations: 'Call', 'WhatsApp'; Team: 'Join the team').
- Every icon slot must show an icon (the hero 'WhatsApp us' button and the footer social buttons are currently **empty squares**).

C5 · Text never cut, never colliding

- No clipped text anywhere (examples: the teardown parts list cut at the right edge, 'SE-4544 · In tra', 'BACK GLAS S' in the final ad).
- Test every section at 1280, 1440 and 1920 px wide in both languages.

C6 · The floating Samsoom button and its hints

- The floating button's speech hints ('Track my order', 'Ask Samsoom', 'Trade prices? Ask me', 'Need a screen?') currently **cover content** (cards, buttons, the showcase image). A hint may only appear where it covers nothing, max ~4 s, and never over a button.
- In Arabic the floating button moves to the bottom-left.

C7 · Information buttons

- Next to every Quality and Manufacturer name (from the Excel: Original, OLED, Incell, AAA… / Service Pack, OEM, GX, ZY…) add a small 'i' button. It opens a small pop-up explaining it (what it is, quality, warranty) with a button 'Learn more' (Coming soon page until the detailed page exists).

DONE WHEN (every box must be true, or the section is not done)

[ ] Zero highlighter titles in the code.
[ ] Every section has an entrance + one continuous motion.
[ ] Every circuit pulses and none touches text.
[ ] Sibling buttons aligned.
[ ] No empty icon slots.
[ ] No cut text at 1280/1440/1920 px in EN and AR.
[ ] Samsoom hints never cover content.

PART D

Arabic rules (replaces the full-mirror rule)

THE OWNER SAID: The Arabic version of the home hero looks so weird; switching the sides exactly opposite wasn't great. Try to keep the same look for both; of course the text is better right-to-left. In the teardown the Arabic version is all wrong: the spacing isn't proper and the elements are not placed the same way as in English. Make sure Arabic gives the exact same look as English but swapped, in a professional and comfortable way, with nothing colliding. In Arabic you can't scroll through the menu; the page scrolls instead.

The rule: mirror the layout, keep the look

- **Measure, then mirror.** Arabic uses the same grid, the same distances and the same sizes as English, flipped left ↔ right. If the gap between the parts list and the phone is 64px in English, it is 64px in Arabic. Never let Arabic spacing drift.
- **Swap whole blocks, don't scramble their insides.** A text column and a device column swap sides. Inside the device group (iPad + phone, teardown phone, ads) the composition stays exactly as designed: same overlap, same angles, same light. Objects are not flipped.
- **Text** is right-aligned and reads right-to-left; numbers, prices, times, codes stay left-to-right inside it.
- **Connectors and pointers** (teardown list lines, labels) attach on the side facing their target: in Arabic the dot sits on the LEFT edge of the component, the line never crosses over a component.
- **Time ranges** keep their order: '10:30–14:00 · 16:00–22:00' (the footer currently shows them reversed).
- **Menus, drop-downs, pop-overs** scroll inside themselves in Arabic (the page must not scroll behind them). Lock the page scroll while a menu is open.
- Full translation of every text, including ads and pop-ups (the final-call ads still use English in places).

DONE WHEN (every box must be true, or the section is not done)

[ ] Side-by-side screenshots EN vs AR of every section: same composition, same spacing, mirrored.
[ ] Teardown connector dots on the left of components in AR, lines never crossing components.
[ ] The menu scrolls in AR.
[ ] Footer hours in the correct order.

PART E

Product system: the owner's Excel

THE OWNER SAID: From now on use only the brands in the logo images, with logos exactly as the companies brand them, and a clear distinction of the groups: BBK / OPlus Group (Oppo, OnePlus, Realme, Vivo); Xiaomi Group (Xiaomi, Redmi, POCO); Transsion Group (Infinix, Tecno); standalone (Apple, Samsung, Google, Huawei, Honor, Nokia). Maybe rank by popularity and group the companies that manage more than one. The Excel from my boss details all products and how the customer should see them: brand, then model (sometimes a series, then models), then the part (the list is fixed across all), then Quality, Colour, Manufacturer as a quick view. As a first view we must list products in a general way; we cover iPads and watches now too. All current stuff focusing on parts must be updated to the new Excel way.

Source file: the owner's Excel (11 sheets). Save it unchanged as **docs/Products.xlsx**. Everything below was read from it on 19 October. Sheet names are partly Arabic; the first sheet is the master structure ('Level 1 to 5'), then one sheet per brand.

E1 · The six levels in the Excel

Level	Excel	What the customer sees
1 · Catalogue	Mobile spare parts · Accessories · Tools · Repair service · Mobile phones · Other products (EN + AR names given)	The six top categories (menu, Find My Part, What we offer). Only **Mobile spare parts** is detailed in the Excel; the other five show as categories with 'Coming soon' until the owner sends their lists.
2 · Brand	Apple, Samsung, Huawei, Xiaomi, Oppo, OnePlus, Google, Nokia, Vivo, Infinix	The 15 brand logos (E2 explains how they map).
3 · Series	Each brand split into series (table E3). OnePlus, Google and Nokia have no series.	A series step only where the Excel has one.
3b · Models	One sheet per brand with the model list per series (≈ 809 models)	Searchable model list.
4 · Part	The fixed list of **30 part names** (same for every model)	Part families first, then the exact part (E4).
5 · Specifications	Quality · Colour · Manufacturer · Special description · Replacement part no.	Quick view chips (E5).
6 · Variant (example)	Samsung A series sheet: each model's screen as 'Full screen with frame' or 'FILL screen' (frameless) × colour	Screens get a Framed / Frameless choice.

PART E · CONTINUED

E2 · Brands: the owner's 15, in his 4 groups

The brand list comes from the owner's message, not from the Excel's sheet layout. The owner decides which companies are independent brands: 15 brands in 4 groups (standalone · Xiaomi Group · BBK / OPlus Group · Transsion Group). The Excel is only the **source of models**: where a brand's models sit inside another sheet (e.g. Honor inside the Huawei sheet, Redmi and POCO inside the MI sheet, Realme inside the Oppo sheet), the import script moves them under their own brand. On the site, Honor is never shown as a Huawei series, Redmi is never a 'Xiaomi series', and so on.

Group (owner)	Brand	Where the import script finds its models
Standalone	Apple	Apple sheet: iPhone (43), iPad (26), Apple Watch (23)
	Samsung	Samsung sheet: 12 series, 227 models (phones + Galaxy Tabs)
	Google	google sheet: 22 Pixel models
	Huawei	huawei sheet: P (28), Y (24), Mate (14), Nova (11)
	Honor	huawei sheet: 'Honor series' (47) + 'Magic series' (4). Show them under the Honor logo; drop the 'Huawei' prefix from the names.
	Nokia	nokia sheet: 30 models
Xiaomi Group	Xiaomi	MI sheet: Mi series (30) + Xiaomi series (13)
	Redmi	MI sheet: Redmi series (73)
	POCO	MI sheet: Pocophone series (18)
BBK / OPlus Group	Oppo	oppo sheet: A (45), Reno (36), F (8), Find X (7)
	Realme	oppo sheet: Realme series (51)
	OnePlus	plus sheet: 29 models
	Vivo	vivo sheet is **empty** → logo shown, 'Models coming soon · Ask us on WhatsApp'
Transsion Group	Infinix	infinix sheet is **empty** → same as Vivo
	Tecno	**not in the Excel** → same as Vivo

Display order (reviewer proposal, confirm with the owner)

Apple · Samsung · Xiaomi Group (Xiaomi, Redmi, POCO) · Huawei · Honor · BBK / OPlus Group (Oppo, Realme, OnePlus, Vivo) · Transsion Group (Infinix, Tecno) · Google · Nokia (most-demanded first, groups kept together). Keep it in one config file (src/content/brands.ts). Pickers show each family as a cluster with a small family label; strips show the same order with thin dividers. **Remove Sony everywhere.** Every '14 brands' becomes '15 brands'.

Logos

- Use the official, current vector logo of each brand, matching the owner's references (reference page). The reference files themselves are references only: some are low quality, the Apple one has a stock-photo watermark, several have coloured backgrounds.
- **Always the newest official logo** (owner decision). Where a reference is outdated, use the current one: e.g. Samsung = the plain SAMSUNG wordmark (no blue ellipse); Nokia = the 2023 logo; Honor = the current ring + wordmark.
- Same size rule: one optical height for all; symbol and name equal height (the 'Apple' name is currently smaller than the apple).

- One shared <BrandLogo/> component everywhere (G18).

PART E · CONTINUED

E3 · Series per brand (from the Excel)

Brand	Series (models)
Apple	iPhone (43, iPhone 4 → 17 Pro Max) · iPad (26) · Apple Watch (23, 1st gen → Series 10)
Samsung	A (77) · M (24) · J (18) · S (38, S3 → S25 Ultra) · Note (10) · Z (20) · Galaxy Tab (9) · Tab A (20) · Tab S (4) · Tab E (2) · Tab Note (1) · Tab Pro (4) · Other (0)
Huawei / Honor	Honor (47) · P (28) · Y (24) · Mate (14) · Nova (11) · Magic (4)
Xiaomi / Redmi / POCO	Mi (30) · Redmi (73) · POCO (18) · Xiaomi (13)
Oppo / Realme	A (45) · Realme (51) · Reno (36) · F (8) · Find X (7)
OnePlus · Google · Nokia	No series: 29 · 22 · 30 models

- **Device type** is a filter, not a level: phones by default, with Tablets (iPad, Galaxy Tab) and Watches (Apple Watch) as quick filters. Tablets and watches appear on the home page too.
- **Interchangeable models (important):** the MI sheet has a list titled (in Arabic) 'identical items that fit each other' (61 groups, e.g. 'Mi 10T Lite / Note 9 Pro'), and the oppo sheet has a similar list (56 groups, e.g. 'A15 - C11 - C12 - C15'). One part fits every model in its group: on a part page show 'Also fits: …', and searching any model in the group finds the part. Confirm with the owner that the Oppo list means the same.
- **Popular in Dubai:** the huawei sheet has a list titled (in Arabic) 'models that sell in Dubai' (69). Use it as a 'Popular' flag (shown first in that brand's list).

E3b · 'This part fits that model': the owner's compatibility lists

The owner remembered the Excel pairing parts with several models. It does, in three places, and this is one of the most useful things on the whole site for a repair shop:

Sheet	List	Example	How the site uses it
MI	'Identical items that fit each other' (61 groups)	Mi 10T Lite = Redmi Note 9 Pro (5G) · Mi 9T = Redmi K20 / K20 Pro · Redmi 9T = POCO M3	One part, many models: the part page shows '**Also fits: …**' with the brand logos; searching ANY model in a group finds the part.
oppo	Untitled list (56 groups, same format)	A15 = Realme C11 = C12 = C15 · A16 = A16s = C25s = A54s	Same as MI (owner to confirm the meaning).
Samsung	Model codes joined with '/'	A42 5G / M42 5G · A105F (A10) / M105 (M10)	Treated as one compatibility group.
huawei	'Models that work (sell) in Dubai' (69)	Honor 10 Lite, Mate 20 Lite, P30 Lite…	A **Popular** tag; shown first in that brand.

- In Find My Part, after picking a model, a small line says 'Same screen as: Redmi K20, K20 Pro' so the customer (and the shop) instantly sees it.
- Cross-brand groups (Xiaomi ↔ Redmi ↔ POCO, Oppo ↔ Realme) show both brand logos side by side on the part card.

E3c · Missing models: research added

The owner asked to find missing models. A separate file, **Sam_Electronics_Catalogue_Additions.xlsx**, lists 69 additions (e.g. iPhone 16e, iPhone Air, Galaxy S25 FE, S26 series, Z Fold7/Flip7, Pixel 9a and Pixel 10 series, Xiaomi 15/15T, Redmi 15, Honor 400, Reno 13/14, OnePlus 13, plus starter lists for Vivo, Infinix and Tecno) and 30 corrections (e.g. 'iPhone 17 Plus' does not exist → iPhone Air; 'OnePlus 12 Pro' does not exist; the Galaxy Tab S column holds Tab Pro models). Each row is marked Verified / Known release / Check before adding. **Import only the rows the owner approves.**

E4 · The 30 parts → 8 families for the first view

The Excel's part list is fixed for every model. The home page and the first step of Find My Part show **families**; the exact part is the next click. Reviewer's grouping below (owner to approve):

Family	Excel parts inside it
Screens	Full display screen · Full display screen with frame · Touch glass
Batteries	Battery
Back covers & housings	Back cover · Back cover with camera lens · Back cover with chassis
Charging & flex	Charging connector flex · Charging plate / audio jack / microphone · Charging connector · Volume flex · Power (on) + volume flex · Main LCD bridge flex
Cameras	Rear camera · Front camera · Front camera & microphone · Camera lens · Camera lens with frame
Audio	Earpiece speaker · Buzzer & speaker · Earphone · Microphone · Sensor and earphone
Small parts	SIM tray · SIM reader & microSD · Fingerprint reader · Screw set · Pen
Protection	Tempered glass · Screen protector

Teardown check: the teardown shows 8 layers including **Logic board** and **Frame**. The Excel has no logic board, and the frame exists only as 'Back cover with chassis' / 'Screen with frame'. Keep the teardown film as it is, but each layer's card and 'Shop' button must point to the matching Excel family; for the logic board show 'Ask us' until the owner confirms.

PART E · CONTINUED

E5 · Quality, Colour, Manufacturer (the quick view)

The Excel separates **Quality** from **Manufacturer**. The site currently mixes them into one 'grade' list (Original, Service Pack, OLED, Incell, High Copy). From now on use the Excel's two lists everywhere:

Spec	Values in the Excel (cleaned spelling)
Quality	Original · Compatible · Standard · AAA · AA · OLED Soft · OLED Big · OLED Small · Incell · Other
Manufacturer	Service Pack · OEM · Refurbished ('Repaied' in the Excel) · OLED · GX · ZY · YK · Taiwan · Other
Colour	Black · White · Blue · Gold · Green · Violet · Silver · Lavender · Lilac · Yellow / Lemon · Mint · Ice blue · Red · Pink · Navy · Orange · Graphite · Burgundy · Cream / Beige · Bronze
Also	Special description (free text) · Replacement part number · Framed / Frameless (screens)

- **'High Copy' is not in the Excel.** Remove it everywhere and use the Excel's qualities.
- Quick view: Quality chips (Original first) → Colour swatches → Manufacturer chips, each with stock and 'from' price (sample), and the 'i' info button (C7).
- Only show the values that exist for that exact part; never show an empty chip.
- Which qualities the home page features (showcase, ads, What we offer cards) is an owner question. Until he answers, feature: Original, OLED, Incell, AAA, and as manufacturers Service Pack and GX.

E6 · Turning the Excel into site data

- Write a script (scripts/import-catalog.ts) that reads docs/Products.xlsx and generates src/content/catalog.ts. Re-running it after the Excel changes updates the site.
- Keep the raw names in the data; add a **display-name cleanup table** for typos, and list every change in docs/CATALOG_CLEANUP.md for the owner. Found so far: 'Serie A' → A series · 'My series' → Mi series · 'Pocophone' → POCO · 'Doogle' → Google · 'HUAWIE' → Huawei · 'Iphone' → iPhone · 'Temperes glass' → Tempered glass · 'Sim trey' → SIM tray · 'connecter' → connector · 'Chassia' → chassis · 'valume' → volume · 'Repaied' → Refurbished · 'Anther/ather' → Other · 'Ping' → Pink · 'Bronza' → Bronze · 'BALCK' → Black · 'LEVENDER' → Lavender · 'Note 9oro' → Note 9 Pro · 'F11 Por' → F11 Pro · 'Engoy 8' → Enjoy 8 · 'S25 (S931' missing bracket · 'Z Fold 6 6G' → 5G? · Apple Watch Series 10 '(2043)' → 2024 · '2rd Generation' → 2nd/3rd? · 'Huawei Honor Huawei Y90'.
- **Duplicates to flag:** the four 'Galaxy Tab Pro 8.4"' models appear under both Tab S and Tab Pro; 'Galaxy Tab 4 (T230)' and two Tab A entries repeat. Show each model once.
- Do not invent models, parts, colours or prices that are not in the Excel. Prices stay SAMPLE until the Control Room exists.
- **Update every place that shows parts** to this data: hero search + iPad, phone ads, brand strip, teardown cards, What we offer, Showcase, Deals, Repair estimator, Pallet builder, Who are you, Samsoom chat, Find My Part menu.

PART E · CONTINUED

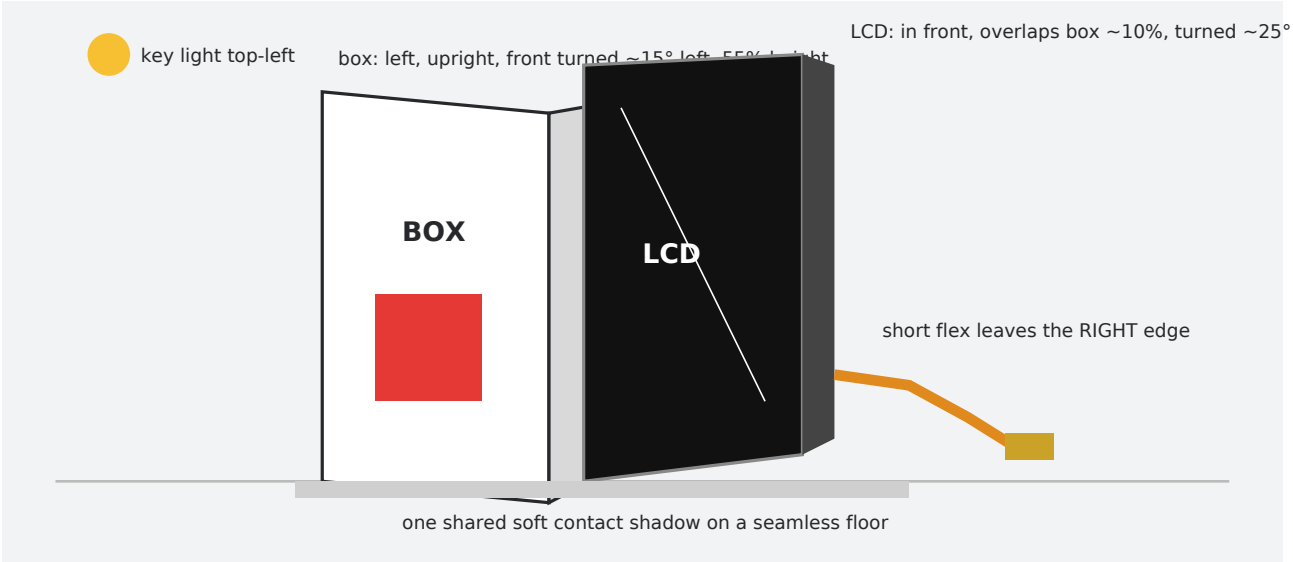

E7 · The new product look: real box + LCD, in 3D

THE OWNER SAID: I uploaded pictures of the packages the products come in, e.g. Samsung Original Service Pack, Apple Original or GX. Take the design and look of each box and make it real, 3D, and use it as the default style: the box first, then the LCD screen to the right, tilted a bit toward the right side, not straight but facing right. I need the same look as the box, detailed as hell. Then the LCD screen we have, but improve the cable: the current LCD has a long cable that eats its size; make the cable come out to the right side. If we implement this change, every single place using these elements must be updated: iPad, the types of screens, whatever it is.

The composition (one standard, used everywhere)

Element	Exact look
Box	Standing upright on its long edge, on the LEFT of the shot, front face turned ~15° toward the viewer's left (3/4 view so its side is visible). About 55% of the shot height. Real printed cardboard reproducing the reference design for that brand + grade: colours, panels, the vertical 'SERVICE PACK' text, labels, barcodes, QR and logo placement. Slightly rounded edges, fine paper texture, a crisp label edge.
LCD	To the RIGHT of the box, slightly in front of it (overlapping the box's right edge by ~10%), standing upright, turned ~25° to face the RIGHT, tilted back ~5°. About 65% of the shot height. Glossy black glass with a soft reflection; frame included only where the real part has one (e.g. Samsung / Google / Infinix / Tecno originals with frame).
Flex cable	Short and neat: it leaves the LCD from its right edge and curves gently down-right, ending in its connector. It never hangs below the screen and never makes the screen look smaller.
Light & floor	Studio key light from top-left, soft rim light on the right edges, one shared soft contact shadow on a seamless floor. Same light everywhere.
Never	Never mirrored in Arabic. Never tilted at random angles. Always the same composition, so every product image on the site looks like one photo shoot.

Layout sketch (front view)

Where the box + LCD appears, and how it moves there

Place	Size / framing	Motion
Hero phone ads	Box + LCD centred between title and description	Unbox: the box slides in from the left, the LCD rises from behind it and turns to its 25° pose (500ms); the shine passes over the LCD glass.
Hero iPad cards	Small thumbnail, same pose	Static (cached image); on hover the LCD turns 5° more and the box label catches the light.
iPad feature screen	Large, one brand at a time (e.g. Samsung Service Pack)	Slow 6° camera orbit while visible, notification banners drop over it.
Teardown info card	Small, next to the part name	Swaps with a quick cross-fade when the highlighted part changes.
What we offer	Medium, on each part card's stage	Joins the cards' shared turntable motion (§06).
Showcase	Full unboxing per quality	Lid lifts, the screen rises and turns, the back of the screen appears behind (§09).
Deals, Repair Lab, Who are you, Pallet builder, Samsoom chat	Card thumbnail	Same pose; enters with its section's entrance.

- **Quality bar:** the boxes must be indistinguishable from the owner's photos at first glance: the same printed panels, exact colours, crisp small print, barcode and QR labels, slightly glossy coated card with a soft highlight on the edges. If a box looks drawn rather than photographed, it is not done.
- The LCD back (seen in the showcase) shows the real flex, the black protective film with its coloured pull-tabs (red for Huawei/Honor, as in the reference) and a small QC sticker.

Which box goes with which product

The box is chosen by **Manufacturer** (Excel) and brand. The owner's reference photos map like this:

Reference image	Use when	Box description
Iphone (Original Service Pack)	Apple · Manufacturer = Service Pack (Quality Original)	Plain white flat box, small barcode label on the lid.
Iphone (GX)	Apple · Manufacturer = GX	Black box, gold-orange 'GX' logo, model name, grey diamond pattern at the bottom.
Iphone (INCELL)	Apple · Manufacturer = ZY (Quality Incell)	Blue gradient box, red 'ZY' tag, 'IN CELL', large model name.
Samsung (Original Service Pack)	Samsung · Service Pack	Light grey 'SVC-SEVT' box with Samsung label, QR and GH82 part code.
Google Pixel, infinix, tecno (Original)	Google, Infinix, Tecno · Service Pack / Original	White 'SVC' box with yellow barcode sticker; screen with frame.
Huawei & Honor (Original Service Pack)	Huawei, Honor · Service Pack	White box, red block, vertical 'SERVICE PACK'; screen with red protective tabs.
Oppo, realme, oneplus, vivo (Original Service Pack)	Oppo, Realme, OnePlus, Vivo · Service Pack	White box, green block, vertical 'SERVICE PACK'.
Xiaomi, redmi, poco (Original Service Pack)	Xiaomi, Redmi, POCO · Service Pack	Orange sleeve box, white inner, vertical 'SERVICE PACK'.
(no reference yet)	Every other manufacturer (OEM, YK, Taiwan, Refurbished, OLED…) and Nokia	Temporary neutral white box with a small Sam Electronics label, marked TEMP in the code until the owner sends a photo.

- Build it as one component: <ProductShot brand model part quality manufacturer/>. Render each combination **once** to cached images (AVIF, several sizes) and reuse them (G15).
- Other parts (batteries, back covers, flex, cameras) keep the studio 3D teardown parts, in the same light and floor. When the owner sends their boxes, they get the same box + part composition.
- Update every place listed in E6 so no old flat or randomly tilted product image remains.

PART E · REFERENCE

The owner's box references

Google Pixel, infinix, tecno(Original)

Huawei & Honor (Original Service Pack)

Iphone (GX)

Iphone (INCELL)

Iphone (Original Service Pack)

Oppo, realme, oneplus, vivo (Original Service Pack)

Samsung (Original Service Pack)

Xioami, redmi, poco (Original Service Pack)

PART E · REFERENCE

The owner's logo references (15 brands)

References only: use the official vector of each, at one shared optical size.

Apple

Google Pixel

Honor

Huawei

Infinix (The Transition Group)

Nokia

One Plus (BBK&OPlus; Group)

Oppo (BBK&OPlus; Group)

Poco (Xiaomi Group)

Realme (BBK&OPlus; Group)

Samsung

Tecno (The Transition Group)

Vivo (BBK&OPlus; Group)

Xiaomi (Xioami Group)

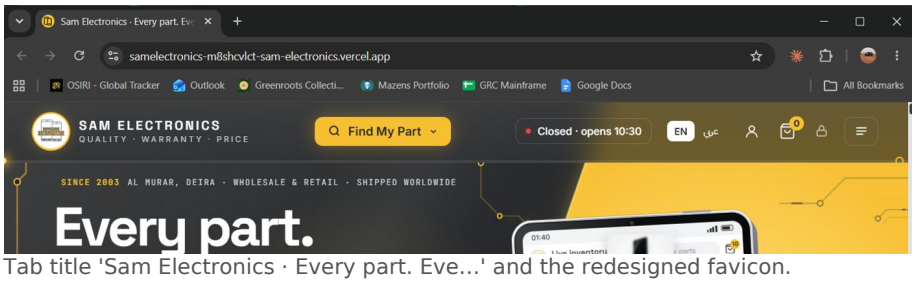

redmi (Xioami Group)

§01 · HOME I1

Browser tab: title and favicon

THE OWNER SAID: The logo in the tab was redesigned; it's wrong, it shows yellow and black frames. Bring back the original: white background with the iconic iPad and phone and text, just like the logo in the header top-left. To make it nicer, add a clear yellow outline to the circle like the header logo. The tab must only show 'Sam Electronics - Home' or whatever part of the website you're on.

Screenshot 01. Tab title 'Sam Electronics · Every part. Eve...' and the redesigned favicon.

- **Favicon:** the original logo (white circle, iPad + phone, the name) exactly as in the header, with a **clear Signal Yellow ring** around it. A simplified 16px version (the two devices only) so it stays crisp. Sizes: SVG, 16/32/48, 180, 192, 512. Undo the yellow/graphite redesign completely.
- **Tab titles:** 'Sam Electronics - Home', '... - Shop', '... - Repair', '... - Wholesale', '... - Contact', etc. Same pattern in Arabic.

REVIEWER'S IDEAS (new, on top of the owner's points)

★ When the visitor switches to another browser tab, the title gently changes to 'Sam Electronics - Your part is waiting' and the favicon's ring dims; it returns to normal when they come back. Small, friendly, memorable.

DONE WHEN (every box must be true, or the section is not done)

[ ] Favicon = original logo + yellow ring, readable at 16px on light and dark tabs.
[ ] Every page's tab title follows the pattern, EN and AR.

§02

Header: hours pop-over, progress bar, logo, menu

THE OWNER SAID: In the hours pill in the bar, the buttons don't work. The progress bar above should let me scroll or go back freely. When the logo is pressed it must take you home immediately. In Arabic you can't scroll through the menu; the page scrolls instead.

- **Hours pop-over:** every button works: 'Get directions' (Google Maps 78G4+3H2), 'WhatsApp' (wa.me/971503420015), 'Call' (tel:+97142733031), 'All hours' (scrolls to Locations).
- **Progress bar:** click + drag scrubber with section labels (Part B3).
- **Logo:** instant return to top (Part B2).
- **Menu in Arabic:** scrolls inside itself; page locked behind it (Part D).

REVIEWER'S IDEAS (new, on top of the owner's points)

★ The progress bar carries tiny section 'pads' (like solder pads) at each section start; the yellow dot lights each pad as you pass it, so the bar reads like a circuit you are travelling along.

★ The hours pop-over shows a small live clock of Dubai time and a thin bar 'Opens in 2h 14m' / 'Closes in 38m', filling in real time.

DONE WHEN (every box must be true, or the section is not done)

[ ] All pop-over buttons open the right thing.

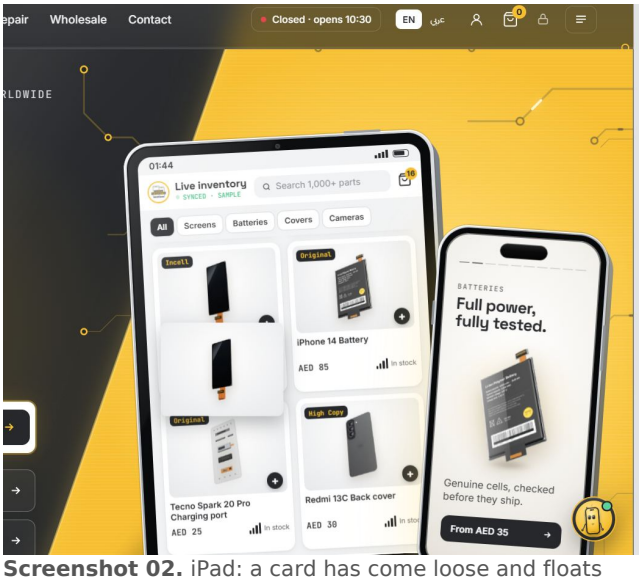

[ ] Progress bar click + drag works, EN and AR.

[ ] Menu scrolls in AR.

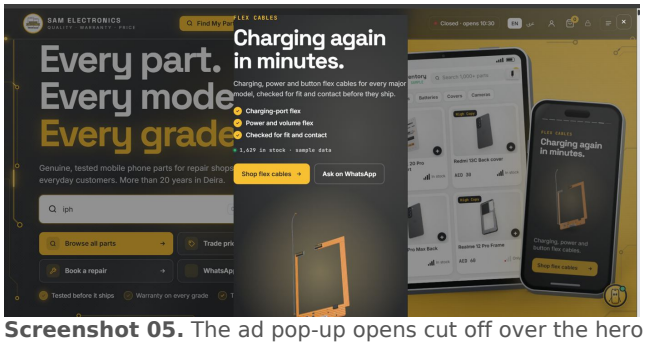

§03 · HOME I2–I12

Hero: search, ticks, phone ads, screens, iPad, Arabic

THE FEEL: The first second decides everything. The visitor should feel they walked into the cleanest, most modern parts counter in Dubai: crisp glass screens catching light, a phone flicking through ads like a real feed, an iPad that is clearly 'live'. Calm confidence, not noise.

Screenshot 02. iPad: a card has come loose and floats over the grid (bug). Products tilted at random angles.

Screenshot 05. The ad pop-up opens cut off over the hero instead of a full poster.

THE FILM (beat by beat)

Beat	What the visitor sees	Time
Arrive	Signature entrance **Power-on**: circuits draw in from the edges (0–700ms), a pulse reaches the iPad and phone, their screens switch on with a soft white flash that settles into the content (no hard blink). Title lines rise one by one (80ms apart), then the search bar, buttons, ticks.	1.6s
Idle	Phone ads cycle (3.2s each, vertical feed). The iPad cycles its screens (E below). Every new ad triggers the glass shine. The ticks' rings light in turn. Circuits carry a pulse every ~4s.	loop
Scroll away	The devices drift up slightly slower than the text (depth), the yellow slab's edge catches a last light sweep as the brand bar arrives.	—

A · Search bar

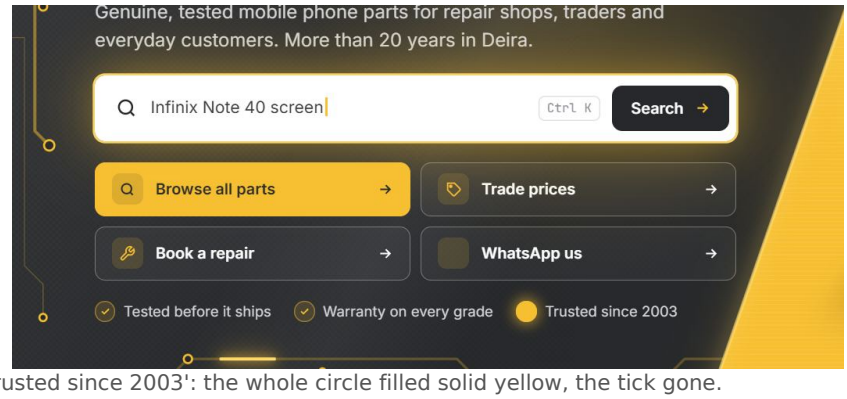

THE OWNER SAID: The examples are fine, but a yellow line (the caret) appears before the new search is typed; it's not smooth. The results list must not get long, it's a shortcut: more than three items → a built-in scroll. Searching must take you to the products page, not keep you there.

- Caret appears with the first typed letter; blinks only at the end; between examples the field is empty; next example starts 300ms after the previous is erased.
- Max 3 suggestion rows; more scroll inside with our custom scrollbar. Each row shows the brand logo, the model, and the matching part families (from the Excel).

- Enter / Search / click → product page or /shop?q=… (G17 'Coming soon' with the term until those pages exist).

B · The three ticks

THE OWNER SAID: Only the circle used to turn yellow, the tick inside was not affected. Now the whole thing lights up like an LED, the tick turns grey, then fades. The tick must not be affected.

Screenshot 03. 'Trusted since 2003': the whole circle filled solid yellow, the tick gone.

- Only the **ring** lights (yellow stroke + soft glow); the tick never changes. Loop: ring 1 glows 1.2s → fades 0.6s → ring 2 → ring 3.

C · Phone ads

THE OWNER SAID: Products are inconsistent: some tilted, others flat. The diagonal shine barely plays, only on white backgrounds; it must play every time a new ad comes in and be more realistic. Scrolling the ads only knows 'up': swiping down must show the previous one. When the mouse or a finger is on it, it should wait a bit before moving. Clicking an ad used to open the full ad clearly with buttons; now it's cut.

Item	Exact behaviour
Product look	Every ad uses the Part E composition (box + LCD for screens; studio part, same pose and light, for others). No random tilts.
Shine	Plays **every time a new ad lands** (300ms after it settles) on the phone; the iPad sweeps 1.5s later; never together. Brighter band on dark ads, softer on light ones; glass only.
Manual scroll	While hovered/touched: wheel down / swipe up = next (feed moves up); wheel up / swipe down = previous (feed moves down), each with its own correct 600ms animation.
Pause	Hover/touch pauses at once; after leaving, wait **3s**, then resume.
Pop-up	The full ad as a **poster**: centred, 9:16, max 88% screen height, fully visible, title + product + description + buttons ('Shop …', 'Ask on WhatsApp'). Blurred page, X, Esc. The poster opens with a zoom-out from the phone screen (the ad grows out of the phone, 450ms), and closes back into it.

D · Glass, frames, background

THE OWNER SAID: The screens look like matte laptop screens, not crystal-clean iPhone glass. The frames look cartoonish; they must look very 3D, high quality and real. The background was sharper and more vivid before; now it's kind of dead.

- **Glass:** deep true blacks, a faint environment reflection (a soft window shape) in the top-left, a thin bright fresnel line on the curved edges, no grey haze.

- **Frames:** brushed titanium/aluminium with a chamfer highlight that moves slightly as the page scrolls (fake parallax light), side buttons, antenna lines, correct bezel, real camera lenses with ring reflections, soft contact shadow.
- **Background:** find the change in git history (overlay, filter, opacity) and restore the previous contrast and saturation.

E · The iPad becomes alive

> **THE OWNER SAID:** Make the iPad interactive, it's boring: ads like Samsung Service Pack, then the carton and the screen, then a message. Wifi, signal and battery move sometimes; notifications like 'just dropped' or 'restocked' drop in and go back up.

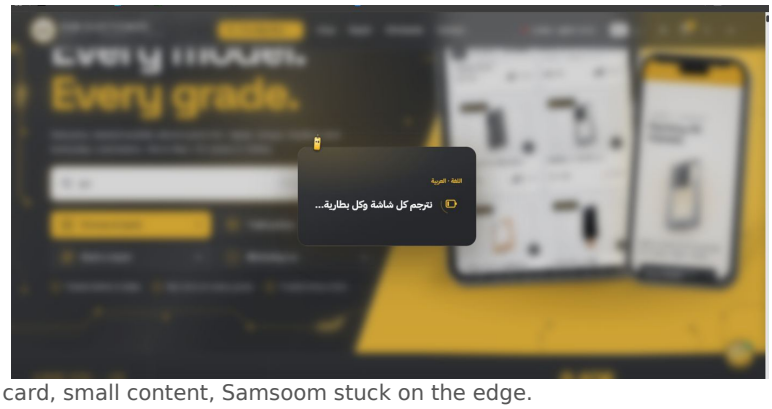

THE IPAD'S OWN FILM

Beat	What the visitor sees	Time
0–6s	Inventory grid (as now), cards in the Part E look.	6s
6–12s	Brand feature: 'Samsung · Service Pack' title, the real 3D box + LCD rotating slowly, 'In stock · from AED …' line.	6s
12–16s	Message screen: 'Same-day trade quotes' with a small animated WhatsApp bubble.	4s
Any time	Every ~10s a notification banner drops from the top: 'New: Galaxy S26 Ultra screens just dropped' / 'Restocked: iPhone 16 batteries' (sample), 3s, slides up.	—
Status bar	Signal and wifi bars flicker occasionally, battery slowly drains then 'charges' with the bolt icon, clock = Dubai time.	—

- Fix: a product card detaches and floats over the grid (Screenshot 02).

F · Language pop-up

> **THE OWNER SAID:** Not professional: the timing changes every time; the frame is big but the text and icon don't fill it; Samsoom sits half outside the top-left. Remove him.

Screenshot 06. Large card, small content, Samsoom stuck on the edge.

- Fixed timing every time: loader 2.0s → 'Mission accomplished!' 1.2s → close.
- Card ~380×140, icon 40px, text 18px, centred, 24px padding. **No Samsoom.**
- Idea: the loader is a tiny circuit trace that draws itself into the shape of the new language's first letter ('A' / 'ع'), then flashes yellow on completion.

G · Arabic hero

Screenshot 07. Arabic: the device group mirrored and the floating Samsoom covering the buttons.

- Text column right, devices left, with exactly the English widths and gaps (Part D). The iPad + phone group keeps the English composition; the yellow slab sits behind them.
- Floating Samsoom bottom-left; never covers a button.

REVIEWER'S IDEAS (new, on top of the owner's points)

★ **Cursor light:** on desktop, a very soft light follows the mouse over the hero background, so circuits and glass edges near the cursor glow slightly. It makes the whole hero feel touchable.

★ **Live counter under the ticks:** 'Parts shipped today: 1,284' rolling up every few seconds (sample until real data).

★ The 'WhatsApp us' button has an empty icon square: add the WhatsApp icon, and make it pulse once when the hero finishes its entrance.

PROTECT (keep exactly as it is)

✓ Separated text and buttons; progress segments; 3.2s timing; colour order; home bar; camera island; globe card; search examples; yellow slab and circuits.

DONE WHEN (every box must be true, or the section is not done)

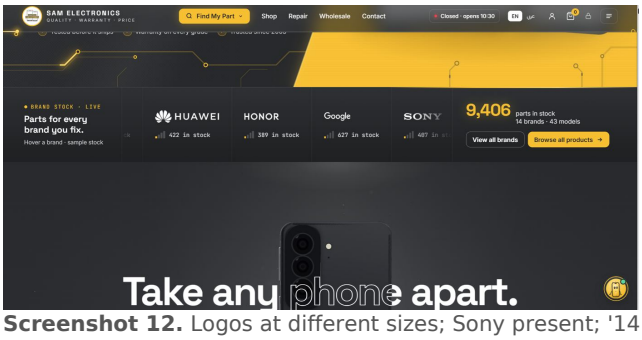

[ ] Search: no early caret, max 3 rows, Enter leaves the hero.
[ ] Ticks: ring only.
[ ] All ads same product composition.
[ ] Shine on every new ad, visible on dark and light.
[ ] Wheel/swipe both ways; 3s wait.
[ ] Poster pop-up full.
[ ] Real glass, real frames, vivid background.
[ ] iPad film plays; notifications drop.
[ ] Language pop-up fixed timing, no Samsoom.
[ ] Arabic: same composition.

§04 · HOME I12

Brand stock bar

THE FEEL: A calm breath after the hero: a quiet, confident strip saying 'we stock every brand you fix'. Smooth, endless, perfectly even.

THE OWNER SAID: All logos must have the same size. Some, like Apple, have the logo at one size and the text smaller. Keep logo and text the same size.

Screenshot 12. Logos at different sizes; Sony present; '14 brands'.

Screenshot 13. Apple symbol larger than its name.

- The owner's 15 brands, newest logos, his group order, thin dividers between groups; Sony removed; '15 brands'.
- One optical height; symbol and name the same height. Seamless loop in EN and AR.

REVIEWER'S IDEAS (new, on top of the owner's points)

★ Hovering a brand pauses the strip, the logo turns full colour, and a small card rises with 'X models · Y parts in stock' and its group name ('Xiaomi Group'); click opens Find My Part on that brand.

★ Group dividers are tiny circuit pads; a pulse travels along the strip's top edge every few seconds.

DONE WHEN (every box must be true, or the section is not done)

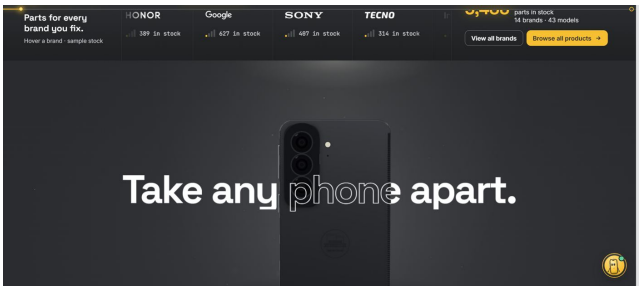

[ ] 15 logos, equal size, no Sony, no gap, hover card works.

§05 · TEARDOWN I1–I7

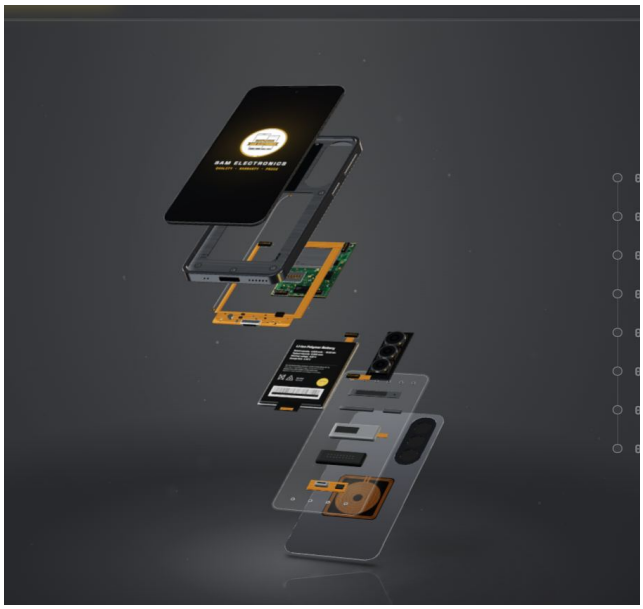

Teardown

THE FEEL: This is the trailer of the whole business. The visitor should hold their breath: a phone appears in darkness, turns slowly like a jewel under a spotlight, then opens into its layers as if time stopped. Every movement is slow, heavy, precise, never twitchy. It must feel expensive.

THE OWNER SAID: Laggy as hell. The back cover edge keeps glitching black and grey. Sometimes the transitions get stuck showing text and phone. Not cinematic enough; it must be smooth and take proper time.

Screenshot 09. Opening: the back crossing the title (keep the outline effect).

Screenshot 14. Opened phone: the parts list is cut off at the right edge.

A · Smoothness

- Fix the back-cover edge flicker for good (z-fighting / depth precision): separate edge geometry or polygonOffset, tighter near/far planes, own edge material. Check frame by frame.
- No step may freeze half-way: each step is a timeline that always completes or reverses cleanly. Part A rules first.

B · The opening

THE OWNER SAID: One scroll shows the title (but the yellow light running through it from left to right is missing). The back appears with cameras crossing the title, then it turns immediately, short and weird, with light hitting the edges. Horrible. It must be one scroll = one step, never skipping because you scrolled too much. Opening is slow and laggy, and the grey LED frames around the parts now need an extra scroll.

THE FILM (beat by beat)

Beat	What the visitor sees	Time
0 · arrive	Darkness with a faint dust haze. 'Take any phone apart.' fades in; a **yellow light runs through the letters left → right** like a scanner, leaving them white.	1.2s

Beat	What the visitor sees	Time
1 · gesture	A spotlight cone opens from above. The back of the phone rises slowly from below into the light; where it crosses the letters they become outlines. The camera lenses catch a glint as they pass the light.	1.4s
2 · gesture	The phone turns **slowly** to show its front, like a jewel on a turntable (ease-in-out, no snap). A single soft highlight glides along the frame edge, no harsh flashes. **During** the turn the title slides to its place and the card and list flow in. The front screen wakes with the logo.	2.0s
3 · gesture	Time stops: the phone opens into its layers **and in the same step** the grey frames draw around each layer; the first frame lights like an LED.	1.6s
4–11	One gesture = one part: its frame lights, its list item ticks, the card updates; dust drifts through the light.	0.8s each
Final	Reassembly and the final call (E below).	—

- Extra scrolling during a step is ignored; fast pass-through as Part B.
- Preload all layers before the section enters.

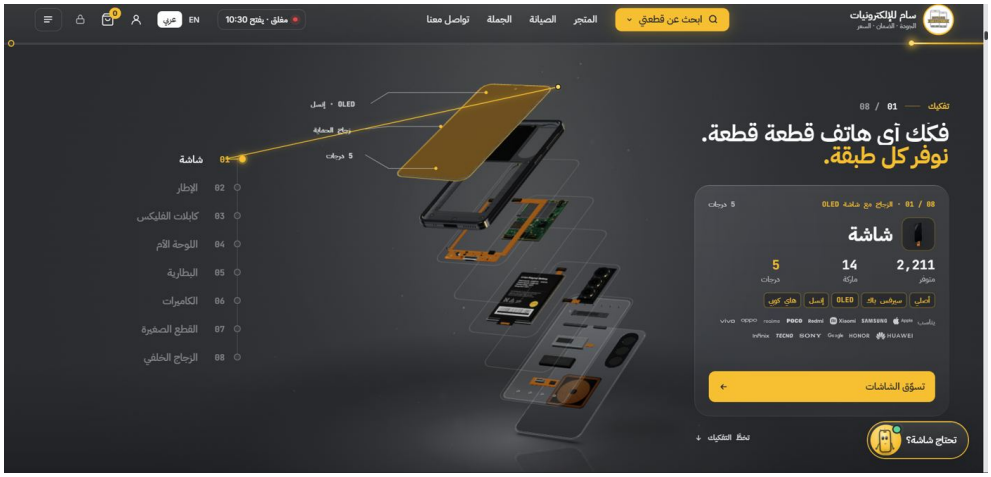

C · The info card

> **THE OWNER SAID:** The brands after 'fits' are tiny and pushed right. Get rid of 'fits'; show the brands available for the selected part, clear: not huge, not tiny.

- No 'Fits' label. Brand logos 20px tall, wrapping across the full card width, reading-start aligned. Qualities from the Excel with 'i' buttons.
- Each layer's 'Shop' button points to its Excel part family; the logic board shows 'Ask us'.

D · Arabic teardown

> **THE OWNER SAID:** In Arabic, the list lines cross over the components because the dots are still on the English side. Dots on the left. Spacing is wrong; the card is too close to the phone. Rework the whole Arabic teardown.

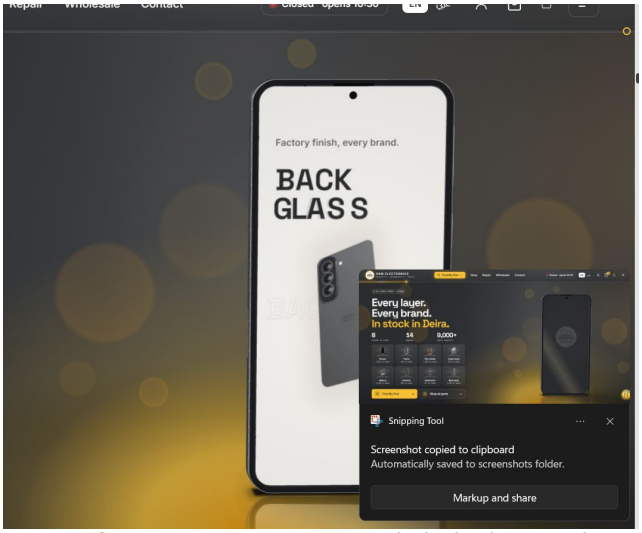

Screenshot 15. Arabic: lines crossing the phone; list too far; card too close; Samsoom hint over the card.

- Exact measured mirror of English (Part D); dots on the left edge of components; no line crosses a component; the turn and final position mirror the English movement.

E · Final-call ads

THE OWNER SAID: Still plain and dead. Stop using capitals. Take the clean hero typography but make these crazier, with lots of movement and transitions. In Arabic the phone uses the English movement: it must move to its own position. Design the ads powerfully.

Screenshot 17. 'BACK GLAS S': capitals, broken word, ghost 'BAC'.

Screenshot 18. The final-call phone screen is empty.

THE FINAL-CALL AD FILM (each ad ~1.3s)

Beat	What the visitor sees	Time
Ad in	The previous ad zooms through the camera (scale 1→1.4 + fade) while the new part flies in from depth, spinning once and landing in the Part E pose with a soft thud of light.	350ms
Hold	The cool line types in small above; the part name lands big (sentence case, hero ad font); a light sweep crosses the part; the 'from AED' price rolls up like an odometer; stock dots fill.	700ms
Ad out	Alternate exits: wipe with a yellow edge · split-flap flip · slide-up feed. Never the same twice in a row.	250ms
Finale	All 8 parts fly in from their layers and assemble into a full phone in the centre of the screen, which flips once and becomes the Sam Electronics logo (the converging circles moment).	1.6s

- No all-caps, no black text. Never an empty screen. Fully translated; the Arabic phone moves to the mirrored position. Final-call stats: '15 brands'.

REVIEWER'S IDEAS (new, on top of the owner's points)

★ Under the final-call buttons, a slim live strip: 'Most searched today: iPhone 15 Pro screen · Galaxy A15 battery · Redmi Note 13 back cover' (sample), sliding slowly.

★ A subtle depth-of-field: the layers not highlighted are very slightly blurred, the highlighted one perfectly sharp, like a macro camera.

PROTECT (keep exactly as it is)

✓ Exploded layers, yellow faded lights, dust in the light, outline title, logo moments, hover open without tilt; the 8 scroll tests plus Part B fast-pass tests.

DONE WHEN (every box must be true, or the section is not done)

[ ] No edge flicker.
[ ] Never freezes; fast scroll passes.
[ ] Steps exactly as the film.

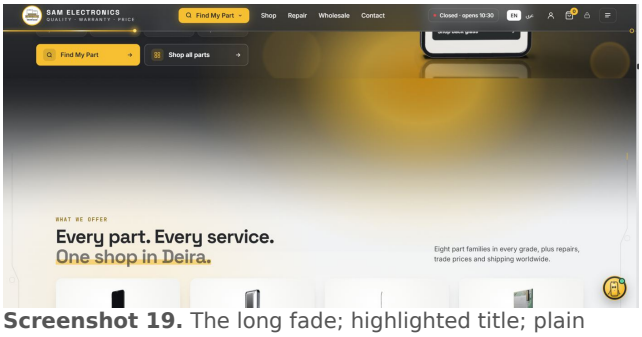

- [ ] Card: logos, no 'fits'.
- [ ] Arabic mirrored correctly.
- [ ] Final ads: hero typography, real motion, finale assembly, never empty.

§06 · TEARDOWN I8–I11

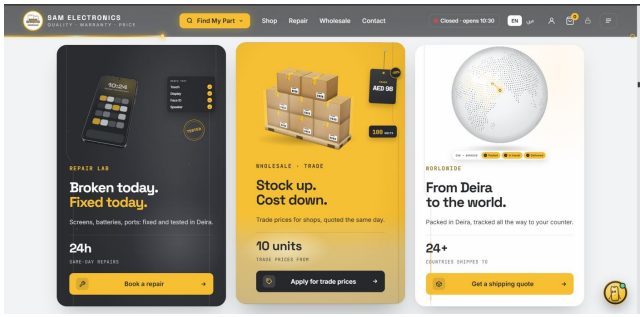

What we offer + the three boxes

THE FEEL: After the dark, intense teardown, the lights come up in a bright, premium showroom. Relief and clarity: 'here is everything we do'. Clean, warm, confident, still moving.

THE OWNER SAID: The grey/yellow shade continuing from the teardown into white doesn't work: cancel it and give this section its own thing, but the white background is dry and plain. Never use highlighted titles. The 3D components move in a cheap way. The boxes holding the products are weak, brief and just white; make the background of the parts stronger and tougher, and fit more info: Original, Incell, copy, OLED...

Screenshot 19. The long fade; highlighted title; plain white part cards.

Screenshot 20. The three boxes: circuits through titles; flat props; buttons misaligned.

A · The showroom (section and part cards)

- No blend from the teardown. The section opens on its own background: warm Fog #F2F3F4 with a very large, faint circuit pattern (5% opacity), soft pools of light from above like showroom spots, and a fine grain. Title: graphite + yellow text, no highlighter.
- **The parts keep moving, but professionally** (owner: he loved the motion, it just has to look premium): every part sits on its own small lit turntable and turns slowly, **all perfectly in sync** (one shared clock, one revolution every 12s, same angle at the same moment), with a reflection sweeping across each part as it turns. No wobble, no float, no jump. On hover the turntable pauses with the part facing the visitor and a spotlight brightens.
- **Strong cards:** a graphite card with a lit stage (soft yellow rim light at the back, glossy black floor reflecting the part), the part, its family name, the Qualities available as chips (Excel: Original, OLED, Incell, AAA...) and Manufacturers (Service Pack, GX...), stock count, models covered, 'from' price (sample), and a 'Shop ...' button.

THE FILM (beat by beat)

Beat	What the visitor sees	Time
Arrive	Signature entrance **Light reveal**: the showroom spots switch on one by one from left to right (120ms apart); each card lifts in under its light and its turntable starts turning.	1.2s
Idle	Synced turntables; a slow reflection sweep across the cards every 8s; chips glow briefly when a 'stock' number ticks.	loop

B · The three boxes (keep the idea; make them professional)

THE OWNER SAID: The circuits go through texts (e.g. through 'Broken today. Fixed today.'); move them away and make them work. Make each element realistic: the phone shows fake empty apps; the boxes could fill up repeatedly, falling one by one to form a stack, then restart; the globe should be the realistic one with borders, a plane from the UAE to a country we serve. Better quality. The buttons below are not aligned.

Box	The scene (hero loop)	Quality notes
Repair (graphite)	A real phone lies on an ESD mat; its cracked screen glows; a precision driver turns; the screen is swapped; the phone wakes to a diagnostic screen (Touch ✓ · Display ✓ · Face ID ✓ · Battery 98%) ticking one by one; a 'TESTED' sticker stamps on. 12s loop.	Device at hero quality; real glass crack; no fake app grid.
Wholesale (yellow)	Keep the owner-loved motion: cartons in the **real Service Pack box designs** drop one by one onto a pallet, forming a neat stack; stretch film winds around with a sheen; a trade price tag swings in; then the pallet slides away and the loop restarts. 10s loop.	Real cardboard, real printed boxes from Part E, real film.
Worldwide (white)	The realistic globe (borders, coastlines, our colours) turns from the UAE; a plane draws a glowing arc to one served country; the country lights up; next loop picks another country from facts.ts. 9s loop.	Same globe as the hero; never a dot-ball.

- Circuits run along the box edges, never through text (24px safe zone), with pulses that travel into each box's button.
- All three buttons: same style, same size, same baseline, bottom-aligned.

REVIEWER'S IDEAS (new, on top of the owner's points)

★ When the visitor hovers a box, its scene speeds up slightly and its circuit pulse races to the button, which glows, inviting the click.

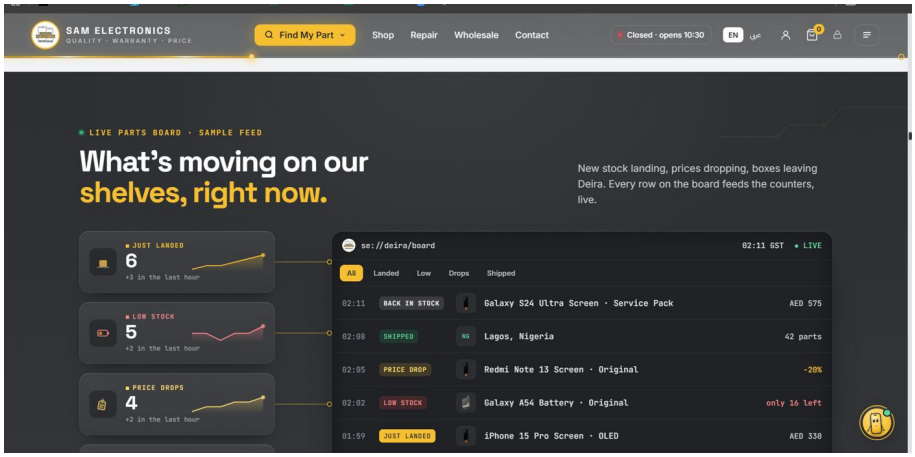

DONE WHEN (every box must be true, or the section is not done)

[ ] Own background, no blend, no highlighter.
[ ] Parts turn in perfect sync, premium, no jumps.
[ ] Cards show qualities, manufacturers, stock, price, button.
[ ] Three scenes realistic; boxes use the real designs; globe realistic.
[ ] No circuit over text; buttons aligned.

§07

Live parts board

THE FEEL: A calm, techy 'control room' moment: the visitor is looking at the shop's heartbeat.

Screenshot 21. Live parts board: keep it.

- Keep the layout and content. Apply the global rules (no highlighter; Excel names).
- **Owner request:** add a few circuits in the background on the left and right sides (low opacity, away from the board and text), with pulses that travel into the board's rows as new rows appear.

REVIEWER'S IDEAS (new, on top of the owner's points)

★ Each new row slides in from the top with a short yellow flash on its status chip; a tiny 'ping' dot travels from the matching side circuit into that row.

★ The left stat cards' sparklines draw in live as the section enters.

DONE WHEN (every box must be true, or the section is not done)

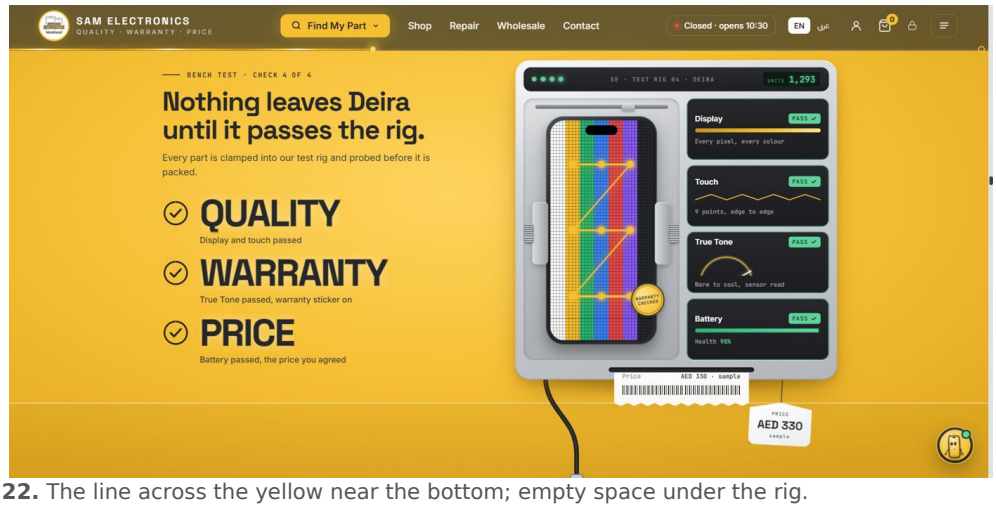

[ ] Side circuits with pulses; rows arrive with the flash.

§08 · BENCH I1–I3

Bench test · check

THE FEEL: Trust you can watch: a real test rig checking a real screen, pass after pass. Satisfying, precise, like a quality-control video.

THE OWNER SAID: To start the show it makes you scroll slightly down when there's nothing below: keep the page centred. A weird line splits the yellow for no reason. The space below is empty: add something useful, creative and fun.

Screenshot 22. The line across the yellow near the bottom; empty space under the rig.

THE FILM (beat by beat)

Beat	What the visitor sees	Time
Arrive	Starts when the section is centred (≥60% visible), no extra scroll. The rig's clamps close on the screen with a soft click-glow.	0.8s
Tests	Display: colour bars sweep · Touch: a 9-point pattern traces · True Tone: the arc needle moves · Battery: health counts to 98%. Each card turns PASS with a green tick.	4s
Done	The warranty sticker stamps onto the screen; the receipt prints with the price.	1s

- Remove the line: one continuous yellow.
- **Fill the space below with 'Today on the rig':** four live counters (Parts tested today · Passed · Sent back to supplier · Warranty stickers applied) rolling up, marked SAMPLE; a 'How we test' button; an 'i' explaining the warranty sticker.

REVIEWER'S IDEAS (new, on top of the owner's points)

★ A small interactive: 'Run the test yourself' button. The visitor clicks and the rig re-runs the test on a screen of their choice (Original / OLED / Incell), showing how each quality scores differently. Fun, and it teaches the qualities.

DONE WHEN (every box must be true, or the section is not done)

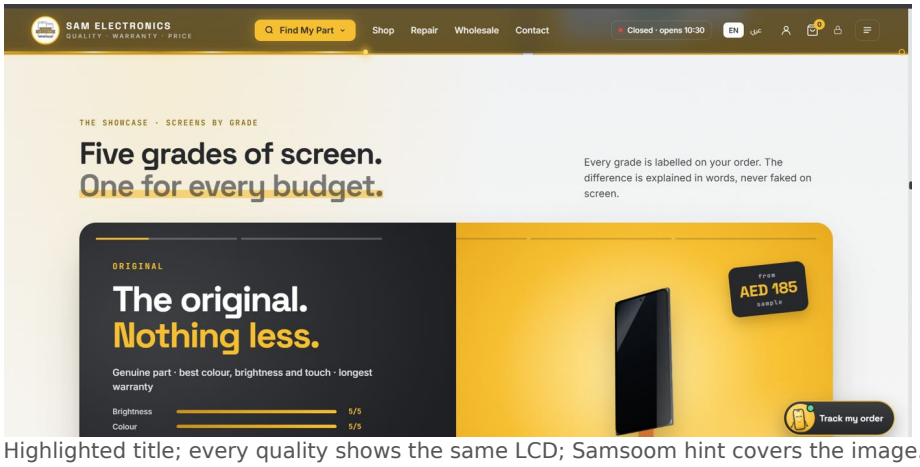

[ ] Starts centred.
[ ] No line.
[ ] Counter strip + optional interactive.

§09 · SHOWCASE I1–I2

Showcase · screens by quality

THE FEEL: An unboxing video in a premium store: each quality is presented like a new product launch, so the customer understands the difference instantly and wants the better one.

THE OWNER SAID: It mustn't force the user to stop. It must play automatically like the ads unless stopped or interrupted, with free scrolling. Make the screens realistic, the unboxing real: box, screen and back of the screen standing, tilted. Right now they're all the same.

Screenshot 23. Highlighted title; every quality shows the same LCD; Samsoom hint covers the image.

THE UNBOXING FILM (auto-plays)

Beat	What the visitor sees	Time
Each quality	The real box (Part E) slides in; the lid lifts; the screen rises out and turns to its 25° pose; its back appears behind it showing the flex and film tabs; the quality bars fill; the 'from' price lands.	4.5s
Change	The box closes and slides out as the next one slides in (direction follows the reading direction).	0.6s

- **No pin.** Free scroll. Progress segments on top; hover pauses; clicking a segment jumps.
- Qualities shown (owner approved): Original, OLED, Incell, AAA, with manufacturers Service Pack and GX as labels. Names from the Excel. No highlighter.

REVIEWER'S IDEAS (new, on top of the owner's points)

★ A 'Compare' toggle: two qualities side by side on the same model, same light, with the brightness/colour bars racing each other.

DONE WHEN (every box must be true, or the section is not done)

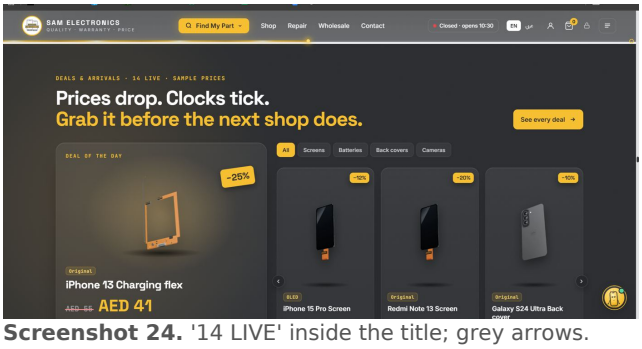

[ ] Never holds the page.
[ ] Each quality visibly different, real unboxing.

§10 · DEALS I1–I4

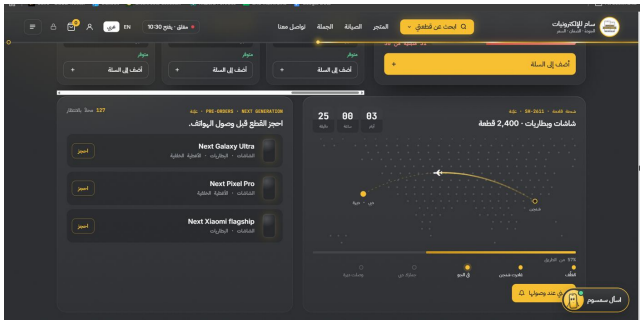

Deals & arrivals

THE FEEL: A busy, exciting market moment: things are moving, prices are dropping, a plane is in the air with fresh stock. Urgency without stress.

THE OWNER SAID: Remove the live count from the title; put it at the side as live data. Beautiful but dead. The list right of the deal of the day must move like the hero brand bar. Replace the grey scroll bar with our own. Loop if there are more than ~3 products. The incoming shipment is dead: move the plane, real progress, real earth map, interactive. Pre-orders: scroll continuously, top to bottom.

Screenshot 24. '14 LIVE' inside the title; grey arrows.

Screenshot 25. Arabic: grey browser scrollbar; dotted map.

THE FILM (beat by beat)

Beat	What the visitor sees	Time
Arrive	Deal of the day rises first with its discount tag swinging in; the rail cards follow from the side like a conveyor.	1s
Idle	Rail drifts continuously (if more than fit); deal-of-the-day countdown ticks; plane flies its arc; pre-orders roll down.	loop

- Title 'Deals & arrivals'; a live chip at the side: pulsing dot + '14 live deals', updating.
- Rail: seamless loop when needed, static when all fit; custom controls; pause on hover/drag.
- Shipment: real earth map (coastlines, borders, our colours), Dubai → Shenzhen arc, plane at the real progress, hover shows ETA; timeline steps light as reached.
- Pre-orders: continuous top → bottom loop, pause on hover.

REVIEWER'S IDEAS (new, on top of the owner's points)

★ When a deal's price drops, the old price is struck through with a quick yellow line and the new price slides in; the card gives a tiny 'shake of excitement' (2px, once).

DONE WHEN (every box must be true, or the section is not done)

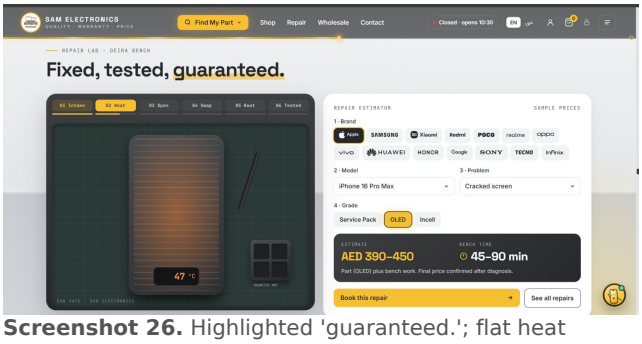

[ ] No count in the title.
[ ] Rail loops correctly; custom controls; no browser scrollbar.
[ ] Real map, moving plane.
[ ] Pre-orders loop.

§11 · REPAIR I1–I3

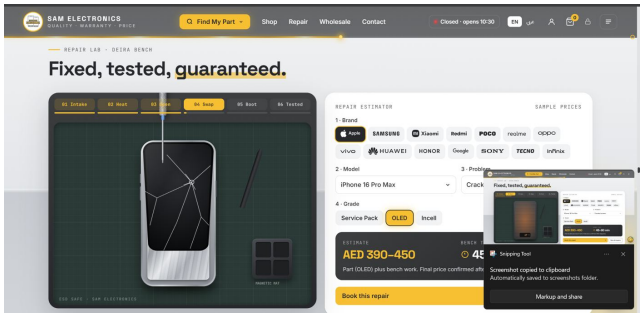

Repair Lab · Deira bench

THE FEEL: Watching a master technician at work through a macro lens: calm hands, warm bench light, precise tools. The visitor should think 'they know exactly what they're doing'.

THE OWNER SAID: Needs the most work. The background is dead white with something like ceramic tiles: stick to electronics-themed things. No highlighter in titles. The repair process is so cartoonish: ultra 3D realistic, every phase.

Screenshot 26. Highlighted 'guaranteed.'; flat heat graphic; Sony listed.

Screenshot 27. Cartoon phone with drawn crack lines.

THE REPAIR FILM (one continuous macro shot, camera gently dollying)

Beat	What the visitor sees	Time
01 Intake	A real phone slides onto the graphite ESD mat; a job ticket prints with the model and problem.	1.5s
02 Heat	The heat plate glows orange with a real heat shimmer; the thermometer climbs to 80°C.	1.5s
03 Open	A suction cup lifts the cracked screen; a pry pick slides along the edge; real shattered glass catches the light.	2s
04 Swap	The old screen lifts away; the new LCD (Part E look) lowers in; the flex clicks into its connector with a small spark of light.	2s
05 Boot	The phone powers on to the Sam Electronics boot logo.	1s
06 Tested	Checklist ticks (Touch, Display, Face ID, Speaker); the warranty sticker is applied.	1.5s

- Background: graphite ESD mat texture with a faint grid and circuit traces, warm overhead bench light. No tiles. No highlighter.
- Estimator: the 15 brands; problems as multi-select chips (Screen, Battery, Charging port/connector, Camera, Back glass, Speaker/mic, Buttons, Water damage, Face ID/fingerprint, Software, Not sure); Quality from the Excel with Original first; Manufacturer second.

REVIEWER'S IDEAS (new, on top of the owner's points)

★ The estimator and the film are linked: choosing 'Battery' in the estimator makes the film switch to a battery swap; choosing 'Charging port' shows a port flex swap. The visitor sees their own repair.

DONE WHEN (every box must be true, or the section is not done)

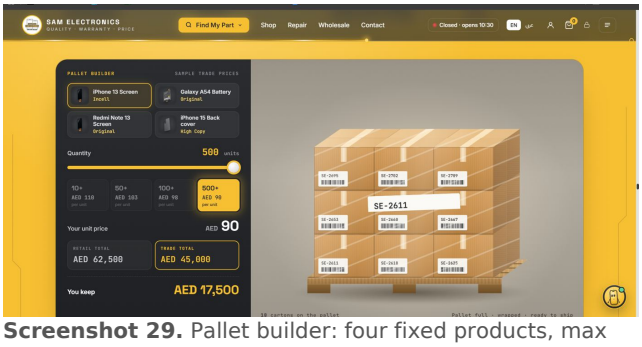

[ ] Themed background.
[ ] Six phases realistic.
[ ] Estimator: multi-select, Original, 15 brands.
[ ] Film reacts to the chosen problem.

§12 · WHOLESALE I1–I4

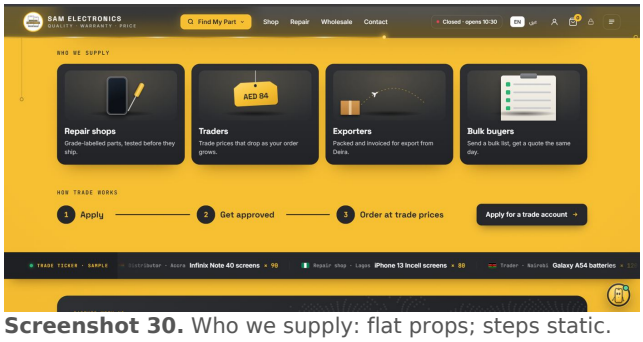

Wholesale & trade

THE FEEL: A real warehouse on a busy morning: tape rolling, pallets filling, trucks leaving. Scale and energy: 'this business moves volume'.

THE OWNER SAID: The top tape: make it roll left to right as if unrolling, keep the glow shine. Pallet builder: let the user pick any product (search). Pallet and boxes are cartoonish; the pallet is unfinished from the back; ultra realistic, with real wrapping. When full, it goes back or the camera zooms out and a new one appears. Max 5,000, not 500. Who we supply: realistic, more motion and detail, matching the boxes. How trade works: icons light up step by step and loop, the numbers unaffected.

Screenshot 29. Pallet builder: four fixed products, max 500, flat cartons.

Screenshot 30. Who we supply: flat props; steps static.

THE PALLET FILM

Beat	What the visitor sees	Time
Arrive	The tape unrolls across the top from the left with its glow shine, revealing the title as it passes.	1s
Build	Each quantity change drops real printed cartons (Part E designs) onto the pallet in order; stretch film winds as the stack grows.	live
Full pallet	The camera pulls back: the wrapped pallet glides into the warehouse depth next to the previous ones (a row grows), a forklift's shadow passes, a new empty pallet rolls in.	1.5s

- Tape: continuous roll (reversed in AR), glow kept.
- Pallet builder: search with autocomplete over the whole catalogue; slider to **5,000**; pallets counter.
- Pallet: real wood grain, finished on every side, real labels, film with sheen.
- Who we supply: realistic props in the same carton quality, each with a short scene (screen clicks into a phone · price tag swings and drops · carton labelled and flown · list stamped).
- How trade works: the ring around each number lights in turn; the number never changes.

REVIEWER'S IDEAS (new, on top of the owner's points)

★ A 'Savings meter' next to the pallet: as quantity grows, a needle swings into the green showing 'You keep AED ...' live.

DONE WHEN (every box must be true, or the section is not done)

[ ] Tape rolls.
[ ] Search any product; max 5,000.

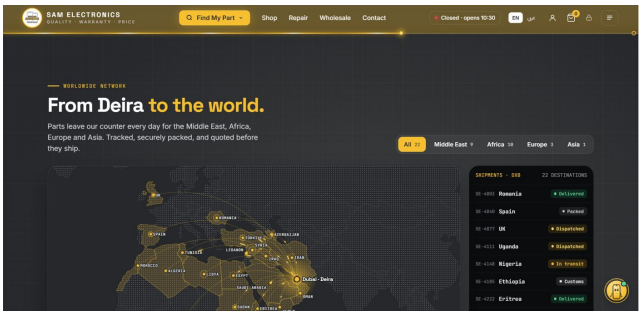

- [ ] Realistic pallet; full pallet → new pallet film.
- [ ] Who we supply realistic.
- [ ] Steps light, numbers unchanged.

§13 · WORLDWIDE I1–I2

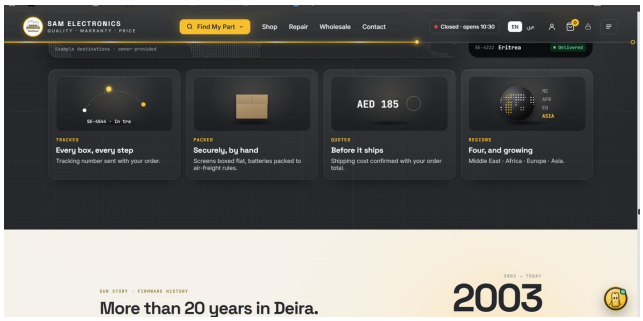

Worldwide network

THE FEEL: Mission control: the visitor watches parts leaving Dubai for the world, live. Pride and reach.

THE OWNER SAID: You removed countries: add Turkey, Azerbaijan, Russia, India, Pakistan, Ukraine, Burkina Faso and Senegal, and update all globes, keeping the style. The four boxes below are really cheap: tracked is a dot on a curved line, packed a cartoon box, quoted just a changing price, and the globe weird and unrealistic.

Screenshot 31. The network map (keep the style).

Screenshot 32. The four boxes; 'SE-4544 · In tra' cut.

- Add the 8 countries to the single list in facts.ts (no duplicates); every map, globe, count and region updates from it (India, Pakistan, Azerbaijan → Asia; Russia, Ukraine → Europe; Burkina Faso, Senegal → Africa).

Box	New scene
Tracked	A real mini map; a parcel icon travels a real route; a timeline (Packed → Dispatched → In transit → Customs → Delivered) lights step by step; the tracking number types in.
Packed	A realistic packing shot: the boxed screen slides into a carton, padding fills, tape seals with a sweep, the label prints and sticks.
Quoted	A quote slip prints line by line (weight, destination, service, insurance); the total counts up; a 'Confirmed' stamp lands.
Regions	The realistic globe turns to each region; the region lights with its name and number of countries.

REVIEWER'S IDEAS (new, on top of the owner's points)

★ Clicking a country on the map opens a small card: typical delivery time, last shipment (sample), and 'Get a quote for [country]' pre-filled on WhatsApp.

DONE WHEN (every box must be true, or the section is not done)

[ ] 8 countries everywhere; counts correct.

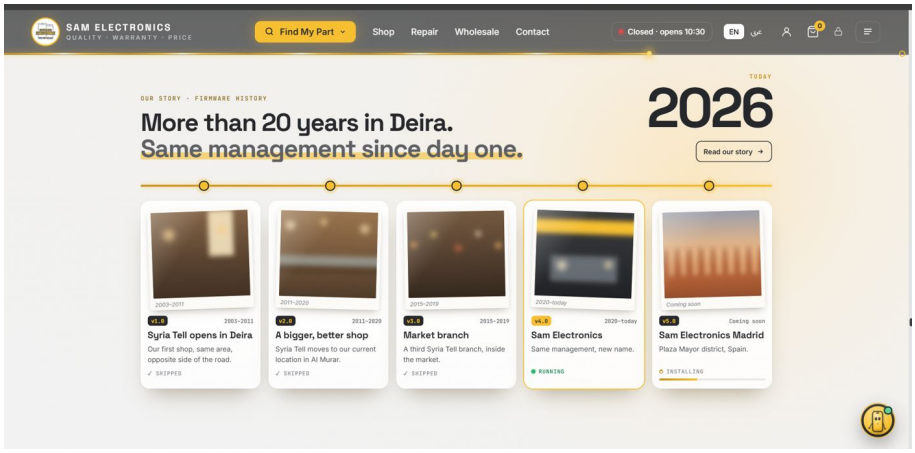

[ ] Four realistic scenes; no cut text.

§14 · STORY I1–I2

Our story · firmware history

THE FEEL: Flipping through a family album that is also a firmware changelog: warm, proud, personal, 23 years of the same family behind the counter.

THE OWNER SAID: No highlighting titles. The background is plain white and boring. One scroll = one step so they don't skip everything, but if they're in a hurry, let them pass.

Screenshot 33. Highlighted title; plain background.

- No highlighter. Background: warm fog with a faint circuit 'timeline' trace behind the cards, soft light, grain; a pulse travels along the trace to the current year.
- Scroll as Part B: one gesture = one year; fast scrolling passes through.

REVIEWER'S IDEAS (new, on top of the owner's points)

★ Each year card 'installs' like firmware: a thin progress bar fills under it and the version tag flips from 'installing' to 'v2.0 · shipped' with a soft click.

★ The big year number flips like a split-flap display between years.

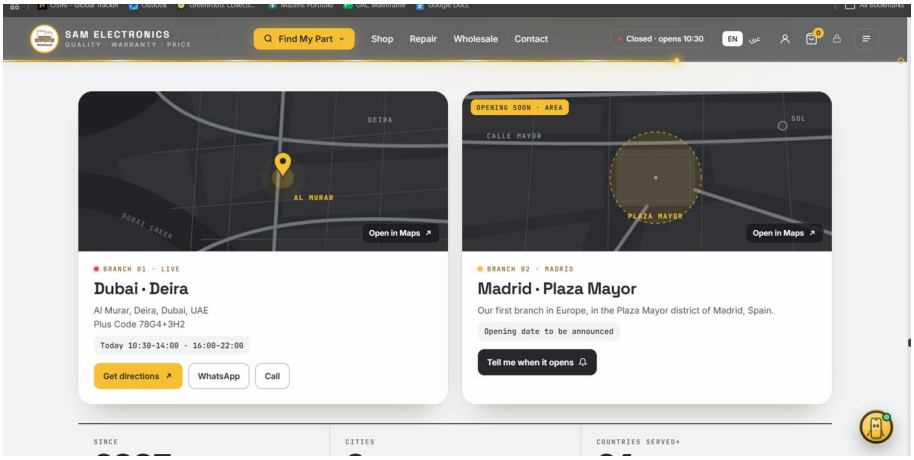

DONE WHEN (every box must be true, or the section is not done)

[ ] No highlighter; themed background; step by step when slow, pass-through when fast.

§15 · STORY I3

Locations: real Google Maps

> **THE OWNER SAID:** Can we use real Google Maps instead of the coded one?

Screenshot 34. Coded maps: replace.

- Real interactive Google Map iframes (no API key: e.g. https://www.google.com/maps?q=78G4%2B3H2+Dubai&output=embed) for Deira and Plaza Mayor (with the 'Opening soon' badge over it).
- Lazy-loaded, rounded like our cards, live status + hours + buttons kept; stats strip from facts.ts.

REVIEWER'S IDEAS (new, on top of the owner's points)

★ A 'Walking directions from Al Ras metro' mini route card under the Deira map; a 'Tell me when it opens' button for Madrid that collects a WhatsApp number (stored when the Control Room exists).

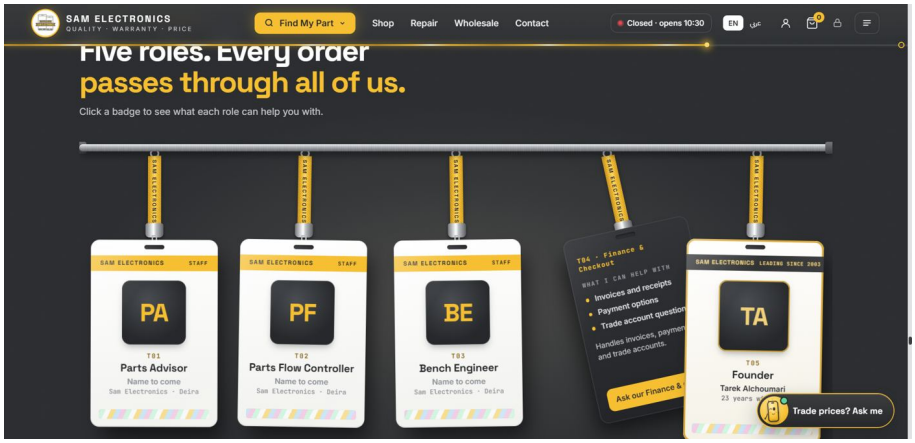

DONE WHEN (every box must be true, or the section is not done)

[ ] Both maps real and interactive.
[ ] No slowdown before the section.

§16

Team + 'Join the team'

THE OWNER SAID: The badge rail is amazing, keep it as is. Don't put the hiring badge in it. Add hiring below in a cool way, with a button that opens a dedicated space for an on-site application: full details, CV upload, everything, with the option to send those details by email or WhatsApp. Jobs: all of them; people may consult and we'll see.

Screenshot 35. The badge rail: keep exactly as is.

Below the rail: the hiring moment

THE FEEL: The visitor has just met the team on their lanyards. Then, right underneath, an empty hook swings slightly with a blank badge on it, and the light finds it: 'This one could be yours.' It should feel warm and inviting, not like a corporate careers page.

THE FILM (beat by beat)

Beat	What the visitor sees	Time
Arrive	Under the rail, a single empty lanyard hook swings in; a blank badge drops onto it with a small bounce of light. On the badge: 'Your name here' in dashed outline, the yellow 'WE'RE HIRING' strip, and the Sam Electronics logo.	0.9s
Idle	The blank badge sways gently; the dashed 'Your name here' types and erases different names ('Ahmed?', 'Sara?', 'You?'); a yellow pulse runs along the lanyard.	loop
Hover	The badge turns to face the visitor; the 'Join the team' button glows.	0.3s

The application space (a drawer, not a new page)

- 'Join the team' opens a full-height side drawer (from the right; from the left in AR) over a blurred page, with the URL hash #join so it can be shared.
- Content: a short welcome line; role cards to choose from: **all roles** (Parts Advisor · Parts Flow Controller · Bench Engineer · Finance & Checkout · Open application); each card says 'Open to applications'.
- Form: full name · phone / WhatsApp · email · city / nationality · languages · years of experience · current role · availability · short message · **CV upload** (PDF/DOC, max 5 MB, drag & drop with progress) · optional photo · consent tick.
- Three ways to send, side by side: **Submit on site** (sends the application + CV to the business email through a server route; stored in the Control Room later) · **Send by email** (opens the email app with all details filled in; asks to attach the CV) · **Send on WhatsApp** (opens WhatsApp with a

filled message; asks to send the CV in the chat).

- Success state: the blank badge from the section fills in with the applicant's name and flips: 'Application received. We'll be in touch.'
- Note: on-site submit with CV needs an email-sending key (Resend) in Vercel; until it's added, that button shows 'Coming soon' and the other two work.

DONE WHEN (every box must be true, or the section is not done)

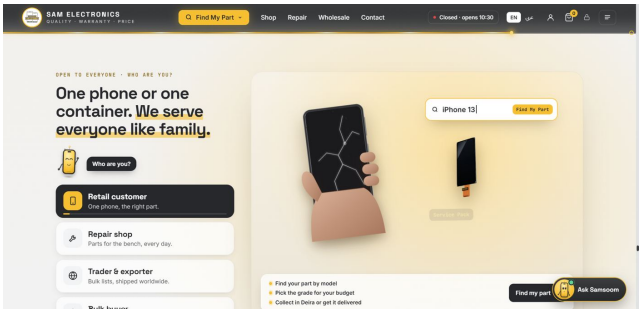

[ ] Rail unchanged.
[ ] Hiring moment below with the swinging blank badge.
[ ] Drawer with roles, full form, CV upload, three send options.
[ ] Success animation.

§17 · WHO I1–I3

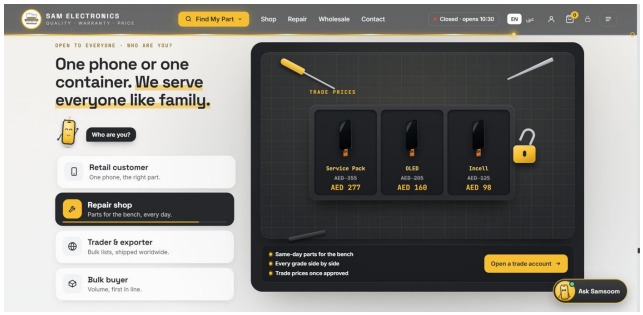

Open to everyone · who are you?

THE FEEL: Personal and welcoming: 'whoever you are, we've already thought about you.' Each choice changes the scene like switching channels on a premium TV.

THE OWNER SAID: The scenes are cartoon as hell, absolutely rejected: rebuild them 3D and realistic. Play time a tiny bit shorter. Remove the cheap Samsoom and move the boxes up. The box icons should move a bit.

Screenshot 36. Retail: cartoon hand and drawn crack.

Screenshot 37. Repair shop: flat tools.

Choice	Scene (realistic, ~10–15% shorter than now)
Retail customer	A real cracked phone on a counter; the matching screen in its real box slides next to it; the search bar types the model; 'Find my part' glows.
Repair shop	A bench with real tools; boxed screens of different qualities line up; trade prices drop in on tags.
Trader & exporter	A real map; the bulk list prints; 'QUOTED' stamps; cartons get labels.
Bulk buyer	The realistic pallet from §12 builds in fast-forward and gets wrapped.

- Remove the small Samsoom and his bubble; move the four choices up. Each icon has an idle motion (phone tilts, wrench turns, globe spins, box lid bounces). No highlighter. Qualities from the Excel.

REVIEWER'S IDEAS (new, on top of the owner's points)

★ Switching choice uses a 'channel change' transition: the scene squeezes to a bright line for 120ms and expands into the next one.

DONE WHEN (every box must be true, or the section is not done)

[ ] Four realistic scenes, shorter.

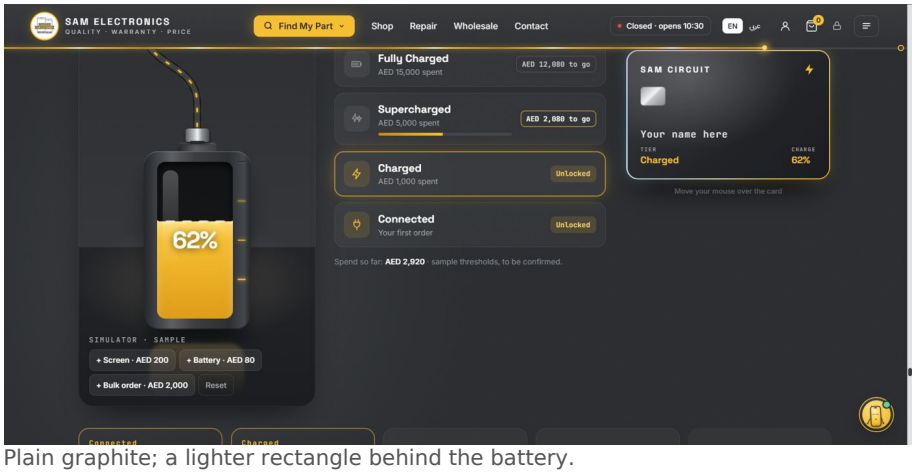

[ ] No Samsoom; boxes up; icons move; no highlighter.

§18

Sam Circuit · membership

THE FEEL: Charging up: every purchase literally fills you with energy. Playful, rewarding, a bit addictive.

THE OWNER SAID: Sam Circuit has more potential for a nicer background than plain grey.

Screenshot 40. Plain graphite; a lighter rectangle behind the battery.

- Background: graphite with circuit traces carrying charge pulses toward the battery, a soft yellow radial glow behind it, a faint grid. Fix the lighter rectangle.

REVIEWER'S IDEAS (new, on top of the owner's points)

★ Each tier unlock triggers a short 'charge burst': the pulses speed up, the battery glows, the member card flips to show the new tier with a holographic sheen.

DONE WHEN (every box must be true, or the section is not done)

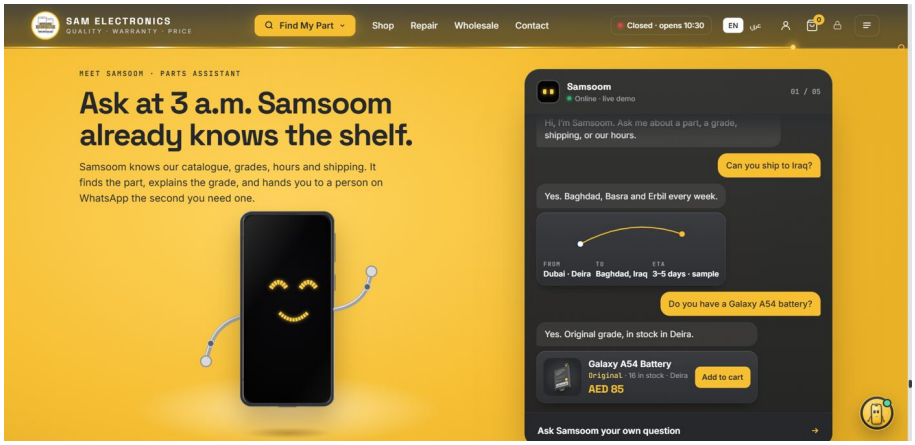

[ ] Themed background; no mismatched rectangle.

§19 · SAMSOOM I1–I3

Meet Samsoom

THE FEEL: Meeting a friendly mascot who actually knows the shelf: funny, cute, helpful. The visitor should smile.

THE OWNER SAID: Horrible: the message bubbles rise only above the title and are cut. No highlighters. Why did you change Samsoom? That's not the real one. He's stuck to the title, with empty unused space.

Screenshot 41. Redesigned Samsoom; empty space; bubbles only at the top.

- Bring back the **real Samsoom** (the floating chat button character) everywhere; delete the redesigned version.
- Centred in the left column with breathing room, soft shadow, idle animation (blink, follow cursor, emotes).
- Bubbles float around Samsoom and the chat over the full section height, never clipped. Use the space: soft circuits, light behind him, faint floating part icons.
- Cart opens anywhere → floating Samsoom does a happy hop toward it.

REVIEWER'S IDEAS (new, on top of the owner's points)

★ Samsoom 'answers' the demo chat: when a reply appears in the chat card, he does the matching emote (thinking dots, thumbs-up, a tiny box he holds up for 'in stock').

DONE WHEN (every box must be true, or the section is not done)

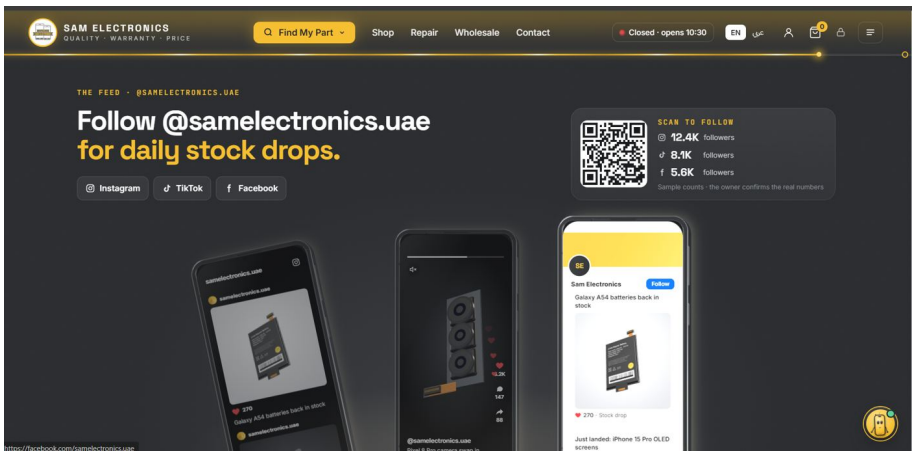

[ ] The real Samsoom everywhere.
[ ] Bubbles not clipped.
[ ] No dead space.
[ ] Cart hop.

§20

The feed · social media

THE FEEL: Scrolling a real, lively social feed: likes popping, comments flying in, new posts arriving. 'Follow us, it's fun.'

THE OWNER SAID: So dead and empty. Only one QR when there are three social accounts; you should be able to choose. The phones are alone; the design is cool but weak.

Screenshot 42. Three accounts but one QR; phones floating alone.

- QR switcher with three tabs (Instagram, TikTok, Facebook, with logos): each shows its own QR, handle and follower count; the QR flips when switching.
- Phones at hero quality on a lit stage in a half-circle carousel, rotating, going behind and coming back.
- Background alive: faded hearts, likes, emojis and circuit pulses rising; live comment bubbles pop beside the front phone. Posts use Part E products.

REVIEWER'S IDEAS (new, on top of the owner's points)

★ Hovering the TikTok phone plays a short looping 'unboxing' clip (CSS/3D, no real video needed); hovering Instagram shows a carousel swipe.

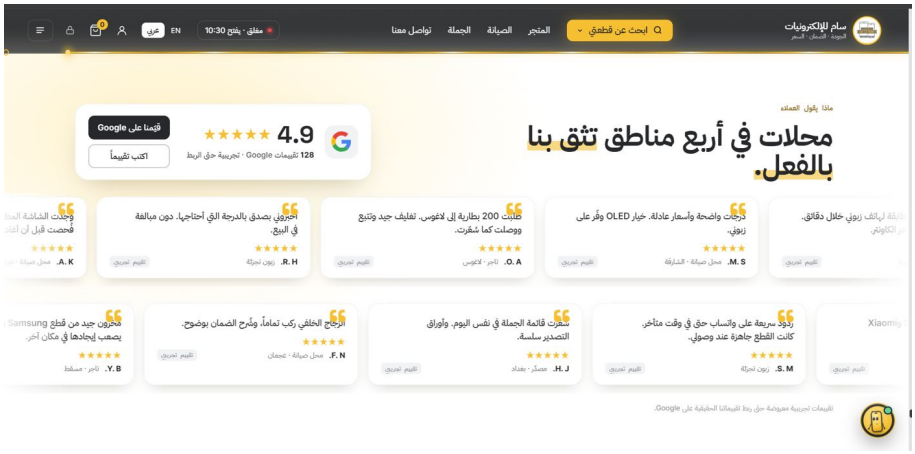

DONE WHEN (every box must be true, or the section is not done)

[ ] Three QRs via tabs.
[ ] Carousel stage.
[ ] Moving background.

§21

What customers say

THE OWNER SAID: Titles can't have highlighted spots. In Arabic the quotes collide with the text.

Screenshot 43. Arabic: highlighter; quote marks over the first line.

- No highlighter. Quote mark on the reading-start side with its own space (text indented 36px), both languages.

REVIEWER'S IDEAS (new, on top of the owner's points)

★ Each review card flips in with its stars filling one by one; the Google rating number counts up to 4.9 as the section enters.

DONE WHEN (every box must be true, or the section is not done)

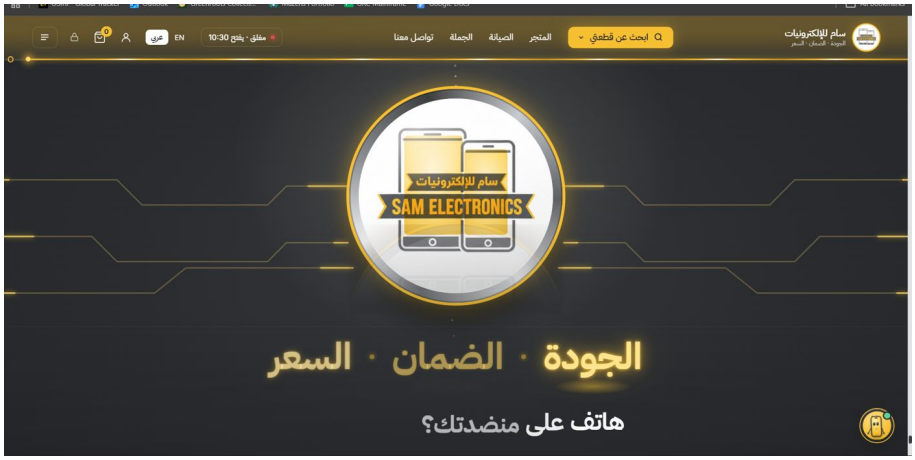

[ ] No highlighter; no collision in AR.

§22

Closing brand moment (after the request console)

THE FEEL: The end credits of a great film. The lights go down, the logo is revealed like a badge being forged, and the three promises light up one by one, each like a power switch being thrown in a dark factory. The visitor should feel: 'this is a serious, proud business.' Slow, confident, premium; never flashy.

THE OWNER SAID: Cheap as hell, needs rebuilding for professionalism; the logo looks AI-generated and huge, and the LED-light words are cheap. (Later: the idea of the slogan lighting up one by one is really cool, it just looks cheap.)

Screenshot 44. Huge logo disc; LED-glow words.

THE CLOSING FILM

Beat	What the visitor sees	Time
0 · dark	The section arrives almost black (graphite #1E1F22). Thin circuit lines on both sides are unlit.	—
1 · forge	From the left and right, a single yellow pulse runs along the circuits toward the centre. Where they meet, the logo (~160px, in a refined brushed-metal ring with a thin yellow inner edge) fades up from darkness with a slow light sweep across its ring. No huge disc, no fake reflection.	1.4s
2 · Quality	A soft 'clack': the word QUALITY switches on: crisp white letters (Space Grotesk, wide tracking), lit from inside for 300ms then settling to white with a thin yellow underline drawing left → right. A tiny proof line fades in under it: 'Five qualities, tested on our rig'.	0.8s
3 · Warranty	Same switch-on for WARRANTY: 'A warranty on every quality'.	0.8s
4 · Price	Same for PRICE: 'Trade prices for shops'. After the third word, all three underlines pulse together once, and the circuits stay softly lit.	0.8s
5 · invite	The headline rises: 'A phone on your bench? We have the part.' and the two main buttons slide up; the 'Find My Part' button gets a slow shine every 6s.	0.8s
Idle	Every ~10s, a pulse travels the circuits into the logo and the ring gleams once. Hovering a word lifts its proof line slightly.	loop

- Keep the request console above it unchanged. Fill the space below with the three proof cards (one under each word) only if the layout needs it; never leave empty space.

DONE WHEN (every box must be true, or the section is not done)

[ ] Logo ~160px premium ring; no LED glow; words switch on one by one with the film above.

[ ] Feels premium, compact, cinematic.

§23

Footer (reviewer findings)

Screenshot 45. Arabic footer: empty social icon squares; hours ranges reversed.

- Social buttons show Instagram, TikTok, Facebook (+ Google) logos (they're empty squares now). Hours in the correct order in both languages.

REVIEWER'S IDEAS (new, on top of the owner's points)

★ A thin circuit runs along the top of the footer and ends in a tiny 'Back to top' pad that sends a pulse up the page when clicked (uses Part B2's fast scroll).

DONE WHEN (every box must be true, or the section is not done)

[ ] Icons visible; hours correct.

§24 · FINAL CHECK

Before you call it done

1. Part A numbers recorded before/after; targets met.
2. Scroll slowly, very fast, by dragging the scrollbar, with the progress bar, and click the logo from the footer: never stuck, never frozen.
3. Every section: its entrance plays, its hero loop and micro loop run, it replays when re-entered (C0).
4. Every section in EN and AR side by side: same composition, mirrored blocks, nothing colliding, no cut text, at 1280/1440/1920.
5. Search the code: no highlighter, no #000, no Sony, no '14 brands', no 'High Copy', no redesigned Samsoom or favicon.
6. Every product uses the Part E box + LCD look; every brand the newest official logo at one size; the catalogue comes from docs/Products.xlsx (+ approved additions).
7. Fill PASS / NOT DONE for Parts A–E and §01–§23 in docs/PROGRESS.md and send the owner the live link.

Open questions for the owner (do not guess)

- Brand order within the groups: is 'most-demanded first' right?
- The 8 part families (E4): approve? Do you sell logic boards?
- The untitled Oppo list: interchangeable models, like the MI list?
- Model lists for Vivo, Infinix, Tecno, and for Accessories, Tools, Phones, Other products.
- Approve the rows in Sam_Electronics_Catalogue_Additions.xlsx and the spelling fixes.
- Box photos for manufacturers without a reference (OEM, YK, Taiwan, Refurbished, OLED) and for Nokia.
